ltdirchk.dtx

1 L^AT_EX System Dependent Initialisations

This file implements the semi-automatic determination of various system dependent parts of the initialisation. The actual definitions may be placed in a file `texsys.cfg`. Thus for operating systems for which the tests here do not result in acceptable settings, a ‘hand written’ `texsys.cfg` may be produced.

The macros that must be defined are:

`\@currdir` `\@currdir{filename}<space>` should expand to a form of the filename that uniquely refers to the ‘current directory’ if this is possible. (The expansion should also end with a space.) on UNIX, this is `\def\@currdir{./}`. For more exotic operating systems you may want to make `\@currdir` a macro with arguments delimited by `.` and/or `<space>`. If the operating system has no concept of directory structure, this macro should be defined to be empty.

`\input@path` If the primitive `\openin` searches the same directories as the primitive `\input`, then it is possible to tell (using `\ifeof`) whether a file exists before trying to input it. For systems like this, `\input@path` should be left undefined.

If `\openin` does not ‘follow’ `\input` then `\input@path` must be defined to be a list of directories to search for input files. The format for each directory is as for `\@currdir`, normally just a prefix is required, but it may be a macro with space-delimited argument. That is, if `<dir>` is an entry in the input path, T_EX will try to load the expansion of `<dir><filename><space>`

So either `<dir>` should be defined as a macro with argument delimited by space, or it should just expand to a directory name, including the final directory separator, so that it may be concatenated with the `<filename>`. This means that for UNIX-like syntax, each `<dir>` should end with a slash, `/`.

`\input@path` should expand to a list of such directories, each in a `{}` group.

`\filename@parse` After a call of the form: `\filename@parse{<filename>}`, the three macros `\filename@area`, `\filename@base`, `\filename@ext` should be defined to be the ‘area’ (or directory), basename and extension respectively. If there was no extension specified in `<filename>`, `\filename@ext` should be `\let` to `\relax` (so this case may be tested with `\ifundefined{filename@ext}` and, perhaps a default extension substituted).

Normally one would not need to define this macro in `texsys.cfg` as the automatic tests can supply parsers that work with UNIX and VMS and Macintosh syntax, as well as a basic parser that will cover many other cases. However some operating systems may need a ‘hand produced’ parser in which case it should be defined in this file.

The UNIX parser also works for most MSDOS T_EX versions. Currently if the UNIX, VMS or Macintosh parser is not used, `\filename@parse` is defined to always return an empty area, and to split the argument into basename and extension at the first ‘.’ that occurs in the name. Parsers for other formats may be defined in `texsys.cfg`, in which case they will be used in preference to the default definitions.

`\@TeXversion` `\@TeXversion` is now set automatically by the initialisation tests in this file. You should not need to set it in `texsys.cfg`, however the following documentation

is left for information. L^AT_EX does not set this variable exactly, the automatic tests set it to:

2 for any version, v , $v < 3.0$

3 for any version, v , $3.0 \leq v \leq 3.14$

undefined otherwise.

However these values are accurate enough for L^AT_EX to take appropriate action for these old T_EXs.

If your T_EX is older than version 3.141, then you should define `\@TeXversion` (using `\def`) to be the version number. If you do not do this¹, L^AT_EX will not work around a bug in old T_EX versions, and so error messages will appear in a very strange format, with `^^J` appearing instead of line breaks:

```
! LaTeX Error: \rubbish undefined.^^J^^JSee the LaTeX manual or LaTeX Companion
for explanation.^^JType H <return> for immediate help.
...
```

```
1.3 \renewcommand{\rubbish}
      {}
?
```

However if you put `\def\@TeXversion{3.14}` in `texsys.cfg` the following format will be used:

```
! LaTeX Error: \rubbish undefined.
```

```
See the LaTeX manual or LaTeX Companion for explanation.
```

```
Type H <return> for immediate help.
```

```
! .
...
```

```
1.3 \renewcommand{\rubbish}
      {}
?
```

Note that this has an extra line `! .` which does not appear in error messages that use the default settings with a current version of T_EX, but this should not cause any confusion we hope.

2 Initialisation

As this file is read at a very early stage, some definitions that are normally considered to be part of the format must be made here.

2.1 INITEX

```
1 \<dircheck>
2 \<initex>
3 \<initex>\ifnum\catcode'\{=1
4 \<initex> \errmessage
5 \<initex> {LaTeX must be made using an initex with no format preloaded}
```

¹Actually if your T_EX is really old, version 2, L^AT_EX can detect this, and sets `\@TeXversion` to 2 if it is not set in the `cfg` file.

```

6 <initex>\fi
7 \catcode'\{=1
8 \catcode'\}=2

```

If Lua_{TEX} is in use the extensions and other new primitives have to be activated: this is done as early as possible. Older versions of Lua_{TEX} do not hide the primitives: a version check is not needed as the version itself will be missing in the case where action is needed!

```

9 \ifx\directlua\undefined
10 \else
11 \ifx\luatexversion\undefined

```

Enable e-TeX/pdfTeX/Umath primitives with their natural names

```

12 \directlua{tex.enableprimitives("",%
13 tex.extraprimitives('etex', 'pdftex', 'umath'))}

```

In current formats enable primitives with unprefix names. the latexrelease guards allow the primitives to be defined with a \luatex prefix if older formats are specified.

```

14 </initex>
15 </dircheck>
16 <*initex, latexrelease>
17 <latexrelease>\ifx\directlua\undefined\else
18 <latexrelease>\IncludeInRelease{2015/10/01}{\luatexluafunction}
19 <latexrelease>{LuaTeX (prefixed names)}%
20 \directlua{tex.enableprimitives("",%
21 tex.extraprimitives("omega", "aleph", "luatex"))}
22 <latexrelease>\EndIncludeInRelease
23 <latexrelease>\IncludeInRelease{0000/00/00}{\luatexluafunction}
24 <latexrelease>{LuaTeX (prefixed names)}%
25 <latexrelease>\directlua{
26 <latexrelease> tex.enableprimitives(
27 <latexrelease> "luatex",
28 <latexrelease> tex.extraprimitives("core","omega", "aleph", "luatex")
29 <latexrelease> )
30 <latexrelease> local i
31 <latexrelease> local t = { }
32 <latexrelease> for _,i in pairs(tex.extraprimitives("luatex")) do
33 <latexrelease> if not string.match(i,"^U") then
34 <latexrelease> if not string.match(i, "^luatex") then
35 <latexrelease> table.insert(t,i)
36 <latexrelease> end
37 <latexrelease> else
38 <latexrelease> if string.match(i,"^Uchar$") then
39 <latexrelease> table.insert(t,i)
40 <latexrelease> end
41 <latexrelease> end
42 <latexrelease> end
43 <latexrelease> for _,i in pairs(t) do
44 <latexrelease> tex.print(
45 <latexrelease> "\noexpand\\let\noexpand\\" .. i
46 <latexrelease> .. "\noexpand\\undefined"
47 <latexrelease> )
48 <latexrelease> end
49 <latexrelease>}
50 <latexrelease>\EndIncludeInRelease

```

```

51 \latexrelease\fi
52 \ifx\latexrelease
53 \*dircheck
54 \*initex
55 \fi
56 \fi

```

A test can now be made for eTeX.

```

57 \ifx\etexversion\undefined
58 \ifx\errmessage
59 \ifx\LaTeX\requires e-TeX
60 \ifx\expandafter\expandafter\expandafter
61 \ifx\fi

```

That distraction over, back to the basics of a format.

3 texsys.cfg

As mentioned above, any site specific definitions required to describe the filename handling must be entered into a file `texsys.cfg`. If `texsys.cfg` can not be located by `\openin`, we write a default version out. The default version only contains comments, so we do not actually input the file in that case. The automatic tests later will, hopefully, correctly define the required macros.

The tricky code below checks to see if `texsys.cfg` exists. If it does not, all the text in this file between `START` and `END` is copied verbatim to a new file `texsys.cfg`. If `texsys.cfg` is found, then it is simply input. This is only done when this file is being used unstripped.

```

113 <docstrip>

```

3.1 texsys.cfg

This file contains the site specific definitions of the four macros `\@currdir`, `\input@path`, `\filename@parse` and `\TeXversion`.

As distributed it only contains comments, however this ‘empty’ file will work on many systems because of the automatic tests built into `ltdirchk.dtx`. You *are* allowed to edit this file to add definitions of these macros appropriate to your system.

The macros that must be defined are:

`\@currdir` `\@currdir{filename}<space>` should expand to a form of the filename that uniquely refers to the ‘current directory’ if this is possible. (The expansion should also end with a space.) on UNIX, this is `\def\@currdir{./}`. For more exotic operating systems you may want to make `\@currdir` a macro with arguments delimited by `.` and/or `<space>`. If the operating system has no concept of directory structure, this macro should be defined to be empty.

`\input@path` If the primitive `\openin` searches the same directories as the primitive `\input`, then it is possible to tell (using `\ifeof`) whether a file exists before trying to input it. For systems like this, `\input@path` should be left undefined.

If `\openin` does not ‘follow’ `\input` then `\input@path` must be defined to be a list of directories to search for input files. The format for each directory is as for `\@currdir`, normally just a prefix is required, but it may be a macro with space-delimited argument. That is, if `<dir>` is an entry in the input path, `TEX` will try to load the expansion of

`<dir><filename><space>`

So either `<dir>` should be defined as a macro with argument delimited by space, or it should just expand to a directory name, including the final directory separator, so that it may be concatenated with the `<filename>`. This means that for UNIX-like syntax, each `<dir>` should end with a slash, `/`. One exception to this rule is that the input path should *always* contain the empty directory `{}` as this will allow ‘full pathnames’ to be used, and the ‘current directory’ to be searched.

`\input@path` should expand to a list of such directories, each in a `{}` group.

`\filename@parse` After a call of the form: `\filename@parse{<filename>}`, the three macros `\filename@area`, `\filename@base`, `\filename@ext` should be defined to be the ‘area’ (or directory), basename and extension respectively. If there was no extension specified in `<filename>`, `\filename@ext` should be `\let` to `\relax` (so this case may be tested with `\@ifundefined{filename@ext}` and, perhaps a default extension substituted).

Normally one would not need to define this macro in `texsys.cfg` as the automatic tests can supply parsers that work with UNIX and VMS syntax, as well as a basic parser that will cover many other cases. However some operating systems may need a ‘hand produced’ parser in which case it should be defined in this file.

The UNIX parser also works for most MSDOS `TEX` versions. Currently if the UNIX or VMS parser is not used, `\filename@parse` is defined to always return an empty area, and to split the argument into basename and extension at the first ‘.’ that occurs in the name. Parsers for other formats may be defined in `texsys.cfg`, in which case they will be used in preference to the default definitions.

`\@TeXversion` You should not need to set this macro in `texsys.cfg`. `LATEX` tests to set this automatically. See the comments in the opening section of `ltdirchk.dtx`.

The following sections give examples of definitions which might work on various systems. These are currently mainly untested as I only have access to a few systems, all of which do not need this file as the automatic tests work. All the code is commented out.

3.2 UNIX (web2c)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
130 %\def\@currdir{./}  
131 %\let\input@path\@undefined
```

3.3 UNIX (other)

Apparently some commercial UNIX implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following (with whatever directories are used at your site): note that the directory names should end with `/`.

```
132 % \def\@currdir{./}  
133 % \def\input@path{%  
134 %   {/usr/local/lib/tex/inputs/distrib/}%  
135 %   {/usr/local/lib/tex/inputs/contrib/}%  
136 %   {/usr/local/lib/tex/inputs/local/}%  
137 % }
```

3.4 MSDOS (emtex)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
138 % \def\@currdir{./}  
139 % \let\input@path\@undefined
```

3.5 MSDOS (other)

Some PC implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following (with whatever directories are used at your site): note that the directory names should end with `/`. This assumes the implementation uses UNIX style `/` as the directory separator.

```
140 % \def\@currdir{./}  
141 % \def\input@path{%  
142 %   {c:/tex/inputs/distrib/}%  
143 %   {c:/tex/inputs/contrib/}%  
144 %   {c:/tex/inputs/local/}%  
145 % }
```

3.6 VMS (DECUS T_EX, PD VMS 3.6)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
146 % \def\@currdir{[]}  
147 % \let\input@path\@undefined
```

3.7 VMS (???)

Some VMS implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following:

```
148 % \def\@currdir{[]}  
149 % \def\input@path{%  
150 %   {tex_inputs:}%  
151 %   {SOMEDISK:[SOME.TEX.DIRECTORY]}%  
152 % }
```

3.8 MACINTOSH (OzTeX 1.6)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
153 % \def\@currdir{:}  
154 % \let\input@path\@undefined
```

3.9 MACINTOSH (other)

Some Macintosh implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following (with whatever folders are used on your machine): note that the directory names should end with `:`, and they should contain *no* spaces.

```
155 % \def\@currdir{:}  
156 % \def\input@path{%  
157 %   {Hard-Disk:Applications:TeX:TeX-inputs:}%  
158 %   {Hard-Disk:Applications:TeX:My-inputs:}%  
159 % }
```

3.10 FAKE EXAMPLE

This example is for an operating system that has filenames of the form `<area>name`. For maximum compatibility with macro sets, you want `name.ext` to be mapped to `<ext>name`. and `<area>name.ext` to be mapped to `<area.ext>name`. `\input` does this mapping automatically, but `\openin` does not, and does not look in the same places as `\input`. `<>name` is the desired ‘current directory’ syntax.

the following code would possibly work:

```
160 % \def\@dir#1#2 {%  
161 %   \@d@r{#1}#2..\@nil}  
162 % \def\@d@r#1#2.#3.#4\@nil{%  
163 %   <\ifx\@dir#1\@dir\else#1\ifx\@dir#3\@dir\else.\fi\fi#3>#2 }  
164 %  
165 % \def\@currdir{\@dir{}}  
166 % \def\input@path{%  
167 %   {\@dir{area.one}}%  
168 %   {\@dir{area.two}}%  
169 % }  
  
END  
  
170 \immediate\closeout15
```

If `texsys.cfg` did exist, then input it.

```

171 \else
172 \typeout{** Using the existing texsys.cfg}
173 \closein15
174 \input texsys.cfg
175 \fi
176 \docstrip

```

If the stripped version of this file is being used (in `latex2e.ltx`) then `texsys.cfg` should be there, so just input it.

```

177 \dircheck\input texsys.cfg

```

4 Setting `\currdir`

`\currdir` This is a local definition of `\IfFileExists`. It tries to relocate `texsys.aux`. If `\IfFileExists` it succeeds, then the `\currdir` syntax has been determined. If all the tests fail then `\currdir` will be set to `\empty`, and `ltxcheck` will warn of this when it checks the format.

```

178 \begingroup
179 \count@ \time
180 \divide \count@ 60
181 \count2 = - \count@
182 \multiply \count2 60
183 \advance \count2 \time

```

`\today` The current date and time stamp.

```

184 \edef \today {%
185   \the year / \two@digits {\the month} / \two@digits {\the day} : %
186   \two@digits {\the count@} : \two@digits {\the count2}}

```

Create a file `texsys.aux` (hopefully in the current directory), then try to locate it again.

```

187 \immediate \openout15 = texsys.aux
188 \immediate \write15 {\today ^^J}
189 \immediate \closeout15 %

```

`#1` is the file to try, `#2` is what to do on success, `#3` on failure. Note that this definition is overwritten later on again!

```

190 \def \IfFileExists #1#2#3 {%
191   \openin \@inputcheck #1 %
192   \ifeof \@inputcheck
193     #3 \relax
194   \else
195     \read \@inputcheck to \reserved@a
196     \ifx \reserved@a \today
197       \typeout {#1 found} #2 \relax
198     \else
199       \typeout {BAD: old file \reserved@a (should be \today)} %
200       #3 \relax
201     \fi
202   \fi
203   \closein \@inputcheck}

```

```
204 \endlinechar=-1
```

If `\@currdir` has not been pre-defined in `texsys.cfg` then test for UNIX, VMS and Oz-TeX-Mac. syntax.

```
205 \ifx\@currdir\undefined
206   \IfFileExists{./texsys.aux}{\gdef\@currdir{.}}%
207   {\IfFileExists{[]texsys.aux}{\gdef\@currdir{[]}}%
208    {\IfFileExists{:texsys.aux}{\gdef\@currdir{:}}{}}}
```

If it is still undefined at this point, all the above tests failed. Earlier versions interactively prompted for a definition at this point, but it seems impossible to reliably obtain information from users at this point in the installation. This version of the file produces a format with no user-interaction. Later if the format is not suitable for the system, `texsys.cfg` may be edited and the format re-made.

```
209 \ifx\@currdir\undefined
210   \global\let\@currdir\empty
211   \typeout{^^J^^J%
212     !! No syntax for the current directory could be found^^J%
213   }%
214 \fi
```

Otherwise `\@currdir` was defined in `texsys.cfg`. In this case check that the syntax specified works on this system. (In case a complete L^AT_EX system has been copied from one system to another.) If the test fails, give up. The installer should remove or correct the offending `texsys.cfg` and try again.

```
215 \else
216   \IfFileExists{\@currdir texsys.aux}{}{%
217     \edef\reserved@a{\errhelp{%
218       texsys.cfg specifies the current directory syntax to be^^J%
219       \meaning\@currdir^^J%
220       but this does not work on this system.^^J%
221       Remove texsys.cfg and restart.}}\reserved@a
222     \errmessage{Bad texsys.cfg file: \noexpand\@currdir}\@@end}
```

The version of `\@currdir` in `texsys.cfg` looks OK.

```
223 \fi

224 \immediate\closeout15 %
225 \endgroup

226 \typeout{^^J^^J%
227   \noexpand\@currdir set to:
228   \expandafter\strip@prefix\meaning\@currdir.^^J%
229 }
```

Stop here if the file is being used unstripped.

```
230 \docstrip
231 \relax\endinput
232 \docstrip
```

5 Setting `\input@path`

Earlier versions of this file attempted to automatically test whether `\input@path` was required, and interactively prompt for a path if necessary. This was not found

to be very reliable The first-time installer of L^AT_EX 2_ε can not be expected to have enough information to supply the correct information to the prompts. Now the interaction is omitted. After the format is made the installer can attempt to run the test document `ltxcheck.tex` through L^AT_EX 2_ε. This will check, amongst other things, whether `texsys.cfg` will need to be edited and the format remade.

```
\input@path Now set up the \input@path.
      \input@path should either be undefined, or a list of directories as described
      in the introduction.
233   \typeout{^^J%
234     Assuming \noexpand\openin and \noexpand\input^^J%
235     \ifx\input@path\undefined

7 T_EX Versions

`\@TeXversion` T_EX versions older than 3.141 require `\@TeXversion` to be set. This can be determined automatically due to a trick suggested by Bernd Raichle. (Actually this will not always get the correct version number, eg T_EX3.14 would be detected as T_EX3, but L^AT_EX only needs to take account of T_EX's older than 3, or between 3 and 3.14.

```

326 \ifx\@TeXversion\@undefined
327 \ifx\@undefined\inputlineno
328 \def\@TeXversion{2}
329 \else

334 \fi
335 \fi

336 \</dircheck>

```

8 lt_xcheck.tex

After the format has been made, and `article.cls` moved with the other files to the 'standard input directory' as specified in `install.txt`, the format may be checked

by running the file `ltxcheck.tex`.

File b

lplain.dtx

9 Plain T_EX

L^AT_EX includes almost all of the functionality of Knuth's original 'Basic Macros'. That is, the plain T_EX format described in Appendix B of the T_EXBook. However, some of the user commands are not much use so, in order to save memory, we may remove them from the kernel into a package. Here is a list of the commands that may be removed (PROBABLY NOT COMPLETE).

```
\magstep      \magstephalf
\mathhexbox
\vglue        \vgl@
\hglue        \hgl@
```

This file is by now very small as most of it has been moved to more appropriate kernel files: it may disappear completely one day.

L^AT_EX font definitions are done using NFSS2 so none of PLAIN's font definitions are in L^AT_EX.

L^AT_EX has its own tabbing environment, so PLAIN's is disabled.

L^AT_EX uses its own output routine, so most of the plain one was removed.

```
1 (*2ekernel)
2 \catcode'\{=1 % left brace is begin-group character
3 \catcode'\}=2 % right brace is end-group character
4 \catcode'\$=3 % dollar sign is math shift
5 \catcode'\&=4 % ampersand is alignment tab
6 \catcode'\#=6 % hash mark is macro parameter character
7 \catcode'\^=7 % circumflex and uparrow are for superscripts
8 \catcode'\_ =8 % underline and downarrow are for subscripts
9 \catcode'\^~I=10 % ascii tab is a blank space
10 \chardef\active=13 \catcode'\^=\active % tilde is active
11 \catcode'\^~L=\active \def^~L{\par}% ascii form-feed is \par
12 \message{catcodes,}
```

We had to define the \catcodes right away, before the message line, since \message uses the { and } characters. When INITEX (the T_EX initializer) starts up, it has defined the following \catcode values:

```
\catcode'\^~@=9 %  ascii null is ignored
\catcode'\^~M=5 %  ascii return is end-line
\catcode'\ =0 %    backslash is TeX escape character
\catcode'\%=14 %   percent sign is comment character
\catcode'\ =10 %   ascii space is blank space
\catcode'\^~?=15 %  ascii delete is invalid
\catcode'\A=11 ... \catcode'\Z=11 % uppercase letters
\catcode'\a=11 ... \catcode'\z=11 % lowercase letters
all others are type 12 (other)
```

Here is a list of the characters that have been specially catcoded:

```
13 \def\dospecials{\do\ \do\\\do\{\do\}\do\$ \do\&%
14 \do\# \do\^ \do\_ \do\% \do\^}
```

(not counting ascii null, tab, linefeed, formfeed, return, delete) Each symbol in the list is preceded by , which can be defined if you want to do something to every item in the list.

We make @ signs act like letters, temporarily, to avoid conflict between user names and internal control sequences of plain format.

```
15 \catcode'@=11
```

To make the plain macros more efficient in time and space, several constant values are declared here as control sequences. If they were changed, anything could happen; so they are private symbols.

```
\@ne Small constants are defined using \chardef.
\tw@ 16 \chardef\@ne=1
\thr@@ 17 \chardef\tw@=2
\sixt@@n 18 \chardef\thr@@=3
\@cclv 19 \chardef\sixt@@n=16
        20 \chardef\@cclv=255

\@cclvi Constants above 255 defined using \mathchardef.
\@m 21 \mathchardef\@cclvi=256
\@M 22 \mathchardef\@m=1000
\@MM 23 \mathchardef\@M=10000
      24 \mathchardef\@MM=20000
```

Allocation of registers

Here are macros for the automatic allocation of \count, \box, \dimen, \skip, \muskip, and \toks registers, as well as \read and \write stream numbers, \fam codes, \language codes, and \insert numbers.

```
25 \message{registers,}
```

When a register is used only temporarily, it need not be allocated; grouping can be used, making the value previously in the register return after the close of the group. The main use of these macros is for registers that are defined by one macro and used by others, possibly at different nesting levels. All such registers should be defined through these macros; otherwise conflicts may occur, especially when two or more macro packages are being used at the same time.

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

The following counters are reserved:

- 0 to 9 page numbering
- 10 count allocation
- 11 dimen allocation
- 12 skip allocation
- 13 muskip allocation
- 14 box allocation
- 15 toks allocation
- 16 read file allocation
- 17 write file allocation
- 18 math family allocation
- 19 language allocation
- 20 insert allocation
- 21 the most recently allocated number
- 22 constant -1

End of historical L^AT_EX 2.09 comments.

New counters are allocated starting with 23, 24, etc. Other registers are allocated starting with 10. This leaves 0 through 9 for the user to play with safely, except that counts 0 to 9 are considered to be the page and subpage numbers (since they are displayed during output). In this scheme, `\count` 10 always contains the number of the highest-numbered counter that has been allocated, `\count` 14 the highest-numbered box, etc. Inserts are given numbers 254, 253, etc., since they require a `\count`, `\dimen`, `\skip`, and `\box` all with the same number; `\count` 20 contains the lowest-numbered insert that has been allocated. Of course, `\box255` is reserved for `\output`; `\count255`, `\dimen255`, and `\skip255` can be used freely.

It is recommended that macro designers always use `\global` assignments with respect to registers numbered

1, 3, 5, 7, 9,

and always non-`\global` assignments with respect to registers

0, 2, 4, 6, 8, 255.

This will prevent “save stack buildup” that might otherwise occur.

```
26 \count10=22 % allocates \count registers 23, 24, ...
27 \count11=9 % allocates \dimen registers 10, 11, ...
28 \count12=9 % allocates \skip registers 10, 11, ...
29 \count13=9 % allocates \muskip registers 10, 11, ...
30 \count14=9 % allocates \box registers 10, 11, ...
31 \count15=9 % allocates \toks registers 10, 11, ...
32 \count16=-1 % allocates input streams 0, 1, ...
33 \count17=-1 % allocates output streams 0, 1, ...
34 \count18=3 % allocates math families 4, 5, ...
35 \count19=0 % allocates \language codes 1, 2, ...
36 \count20=255 % allocates insertions 254, 253, ...
```

```
\insc@unt The insertion counter and most recent allocation.
\allocationnumber 37 \countdef\insc@unt=20
38 \countdef\allocationnumber=21
```

```
\m@ne The constant -1.
39 \countdef\m@ne=22 \m@ne=-1
```

```
\wlog Write on log file (only)
40 \def\wlog{\immediate\write\m@ne}
```

```
\count@ Here are abbreviations for the names of scratch registers that don't need to be
\dimen@ allocated.
\dimen@i 41 \countdef\count@=255
\dimen@ii 42 \dimendef\dimen@=0
\skip@ 43 \dimendef\dimen@i=1 % global only
\toks@ 44 \dimendef\dimen@ii=2
45 \skipdef\skip@=0
46 \toksdef\toks@=0
```

```
\newcount Now, we define \newcount, \newbox, etc. so that you can say \newcount\foo and
\newdimen \foo will be defined (with \countdef) to be the next counter.
\newskip To find out which counter \foo is, you can look at \allocationnumber.
\newmuskip Since there's no \boxdef command, \chardef is used to define a \newbox,
\newbox \newinsert, \newfam, and so on.
\newtoks
\newread
\newwrite
\newfam
\newlanguage
```

L^AT_EX change: remove `\outer` from `\newcount` and `\newdimen` (FMi) This is necessary to use `\newcount` inside `\if...` later on. Also remove from `\newskip`, `\newbox` `\newwrite` and `\newfam` (DPC) to save later redefinition.

```

\rbrack 363 \def\lbrack{[ }
364 \def\rbrack{[ }

```

```

\aa These are not from plain.tex but they are similar to other commands found here
\AA and nowhere else, being alternate input forms for characters.
365 \def \aa {\r a}
366 \def \AA {\r A}

\endgraf
\endline 367 \let\endgraf=\par
368 \let\endline=\cr

\space
369 \def\space{ }

\empty This probably ought to go altogether, but let it to the LATEX version to save space.
370 \let\empty\@empty

\null
371 \def\null{\hbox{}}

\bgroup
\egroup 372 \let\bgroup={
373 \let\egroup=}

\obeylines In \obeylines, we say \let^^M=\par instead of \def^^M{\par} since this allows,
\obeyspaces for example, \let\par=\cr \obeylines \halign{...
374 {\catcode'\^^M=\active % these lines must end with %
375 \gdef\obeylines{\catcode'\^^M\active \let^^M\par}%
376 \global\let^^M\par} % this is in case ^^M appears in a \write
377 \def\obeyspaces{\catcode'\ \active}
378 {\obeyspaces\global\let \=\space}

\loop We use Kabelschacht's method of doing loops, see TUB 8#2 (1987). (unless that
\iterate breaks something :-). It turned out to need an extra \relax: see pr/642 (\loop
\repeat could do one iteration too much in certain cases).
379 \long\def \loop #1\repeat{%
380 \def\iterate{#1\relax % Extra \relax
381 \expandafter\iterate\fi
382 }%
383 \iterate
384 \let\iterate\relax
385 }

This setting of \repeat is needed to make \loop...\if...\repeat skippable
within another \if....
386 \let\repeat=\fi

LATEX defines \smallskip, etc. in lt-space.dtx.

\nointerlineskip
\offinterlineskip 387 \def\nointerlineskip{\prevdepth-\@m\p@}

\m@th
410 \def\m@th{\mathsurround\z@}

\underbar Due to LATEX's redefinition of \underline plain TEX's \underbar can be done in
a simpler fashion (but do we need it at all?).
411 \def\underbar#1{\underline{\sbox\tw@{#1}\dp\tw@\z@\box\tw@}}

\strutbox LATEX sets \strutbox in \set@fontsize.
\strut 412 \newbox\strutbox
413 \def\strut{\relax\ifmmode\copy\strutbox\else\unhcopy\strutbox\fi}

\hidewidth For alignment entries that can stick out.
414 \def\hidewidth{\hskip\hideskip}

```

`\narrower`

```
415 \def\narrower{%
416   \advance\leftskip\parindent
417   \advance\rightskip\parindent}
```

L^AT_EX defines `\ae` and similar commands elsewhere.

```
418 \chardef\%='\'%
419 \chardef\&='&%
420 \chardef\#='#&%
```

Most text commands are actually encoding specific and therefore defined later, so commented out or removed from this file.

`\leavevmode` begins a paragraph, if necessary

```
421 \def\leavevmode{\unhbox\voidb@x}
```

`\mathhexbox`

```
422 \def\mathhexbox#1#2#3{\mbox{$\m@th \mathchar"#1#2#3$}}
```

`\ialign`

```
423 \def\ialign{\everycr{}\tabskip\z@skip\halign} % initialized \halign
```

`\oalign`

`\o@lign`

`\ooalign`

```
424 \def\oalign#1{\leavevmode\topof\baselineskip\z@skip \lineskip.25ex%
425   \ialign{##\crrc#1\crrc}}
426 \def\o@lign{\lineskiplimit\z@ \oalign}
427 \def\ooalign{\lineskiplimit-\maxdimen \oalign}
```

`\sh@ft`

The definition of this macro in `plain.tex` was improved in about 1997; but as a result its usage was changed and its new definition is not appropriate for L^AT_EX.

Since the version given here has been in use by L^AT_EX for many years it does not seem prudent to remove it now. As far as we can tell it has only been used to define `\b` and `\d` but this cannot be certain.

```
428 \def\sh@ft#1{\dimen@.00#1ex\multiply\dimen@\fontdimen1\font
429   \kern-.0156\dimen@} % compensate for slant in lowered accents
```

`\ltx@sh@ft`

This is the L^AT_EX version of the second incarnation of the plain macro `\sh@ft`, which takes a dimension as its argument. It shifts a pseudo-accent horizontally by an amount proportional to the product of its argument and the slant-per-point (`fontdimen 1`).

```
430 \def\ltx@sh@ft #1{%
431   \dimen@ #1%
432   \kern \strip@pt
433     \fontdimen1\font \dimen@
434 } % kern by #1 times the current slant
```

L^AT_EX change: the text commands such as `\d`, `\b`, `\c`, `\copyright`, `\TeX` are now defined elsewhere.

L^AT_EX change: Make `\t` work in a moving argument. Now defined elsewhere.

```

\hrulefill  LATEX change: \kern\z@ added to end of \hrulefill and \dotfill to make them
\dotfill    work in ‘tabular’ and ‘array’ environments. (Change made 24 July 1987). LATEX
            change: \leavevmode added at beginning of \dotfill and \hrulefill so that
            they work as expected in vertical mode.
435 \def\hrulefill{\leavevmode\leaders\hrule\hfill\kern\z@}

The box in \dotfill originally contained (in plain.tex):
\mkern 1.5mu .\mkern 1.5mu;
the width of .44em differs from this by .04pt which is probably an acceptable
difference within leaders.
436 \def\dotfill{%
437   \leavevmode
438   \cleaders \hb@xt@ .44em{\hss.\hss}\hfill
439   \kern\z@}

INITEX sets \sfcode x=1000 for all x, except that \sfcode‘X’=999 for upper-
case letters. The following changes are needed:
440 \sfcode‘\’=0 \sfcode‘\’=0 \sfcode‘\’=0

The \nonfrenchspacing macro will make further changes to \sfcode values.
Definitions related to output
\magnification doesn’t work in LATEX.

ltvers.dtx

10 Version Identification

First we identify the date and version number of this release of L^AT_EX, and set `\everyjob` so that it is printed at the start of every L^AT_EX run.

`\fmtname` A `\patch@level` of 0 or higher denotes an official public release. A negative value indicates a candidate release that is not distributed.

`\fmtversion` If we put code updates into the kernel that are supposed to go into the next release we set the `\patch@level` to -1 and the `\fmtversion` / `\latexreleaseversion` to the date of the next release (guessed, the real value is not so important and will get corrected when we make the release official).

`\patch@level` If the `\patch@level` is already at -1 we do nothing here and use the `\fmtversion` date for any new `\IncludeInRelease` line when we add further code.

Finally, if we do make a public release we either just set the `\patch@level` to zero (if our initial guess was good) or we also change the date and then have to additionally change to that date on all the `\IncludeInRelease` statements that used the “guessed” date.

```

1 (*2ekernel)
2 \def\fmtname{LaTeX2e}
3 \edef\fmtversion

6 (*2ekernel| latexrelease)
7 {2020-02-02}
8 (/2ekernel| latexrelease)
9 (*2ekernel)
10 \def\patch@level{2}

```

`\development@branch@name` For more fine grain control there is the possibility to name the current development branch. This is only used when the `\patch@level` is negative (i.e., a pre-release format) and is intended to help us internally when we locally install a format out of some development branch.

```

11 \edef\development@branch@name{}

```

Check that the format being made is not too old. The error message complains about ‘more than 5 years’ but in fact the error is not triggered until 65 months.

This code is currently not activated as we don’t know if we already got to the last official 2e version (due to staff shortage or due to a successor (think positive:-)).

```

ltxdefns.dtx

11 Definitions

This section contains commands used in defining other macros.

```
1 (*2ekernel)
```

11.1 Initex initialisations

`\two@digits` Prefix a number less than 10 with ‘0’.

```
2 \def\two@digits#1{\ifnum#1<10 0\fi\number#1}
```

`\typeout` Display something on the terminal.

```
3 \def\typeout#1{\begingroup\set@display@protect
4   \immediate\write\@unused{#1}\endgroup}
```

`\newlinechar` A char to be used as new-line in output to files.

```
5 \newlinechar‘^^J
```

11.2 Saved versions of TeX primitives

The TeX primitive `\foo` is saved as `\@foo`. The following primitives are handled in this way:

`\@@par`

```
6 \let\@@par=\par
7 %\let\@@input=\input      %%% moved earlier
8 %\let\@@end=\end          %%%
```

`\@@hyph` Save original primitive definition.

```
9 \let\@@hyph=\-
```

`\@@italiccorr` Save the original italic correction.

```
10 \let\@@italiccorr=\/
```

`\@height` The following definitions save token space. E.g., using `\@height` instead of `height`
`\@depth` saves 5 tokens at the cost in time of one macro expansion.

```
11 \def\@height{height} \def\@depth{depth} \def\@width{width}
12 \def\@minus{minus}
13 \def\@plus{plus}
```

`\hb@xt@` The next one is another 100 tokens worth.

```
14 \def\hb@xt@{\hbox to}
15 \message{hacks,}
```

11.3 Command definitions

This section defines the following commands:

<code>\@namedef</code>	<code>{\NAME}</code>	Expands to <code>\def\{NAME}</code> , except name can contain any characters.
<code>\@nameuse</code>	<code>{\NAME}</code>	Expands to <code>\{NAME}</code> .
<code>\@ifnextchar</code>	<code>X{\YES}{\NO}</code>	Expands to <code>\YES</code> if next character is an ‘X’, and to <code>\NO</code> otherwise. (Uses <code>\reserved@a–\reserved@c.</code>) NOTE: GOBBLES ANY SPACE FOLLOWING IT.
<code>\@ifstar</code>	<code>{\YES}{\NO}</code>	Gobbles following spaces and then tests if next the character is a ‘*’. If it is, then it gobbles the ‘*’ and expands to <code>\YES</code> , otherwise it expands to <code>\NO</code> .
<code>\@dblarg</code>	<code>{\CMD}{\ARG}</code>	Expands to <code>\{\CMD\}[\ARG]{\ARG}</code> . Use <code>\@dblarg\CS</code> when <code>\CS</code> takes arguments <code>[ARG1]{ARG2}</code> , where default is <code>ARG1 = ARG2</code> .
<code>\@ifundefined</code>	<code>{\NAME}{\YES}{\NO}</code>	: If <code>\NAME</code> is undefined then it executes <code>\YES</code> , otherwise it executes <code>\NO</code> . More precisely, true if <code>\NAME</code> either undefined or <code>= \relax</code> .
<code>\@ifdefinable</code>	<code>\NAME{\YES}</code>	Executes <code>\YES</code> if the user is allowed to define <code>\NAME</code> , otherwise it gives an error. The user can define <code>\NAME</code> if <code>\@ifundefined{NAME}</code> is true, ‘NAME’ \neq ‘relax’ and the first three letters of ‘NAME’ are not ‘end’, and if <code>\endNAME</code> is not defined.
<code>\newcommand</code>	<code>*{\FOO}[i]{\TEXT}</code>	User command to define <code>\FOO</code> to be a macro with <i>i</i> arguments (<i>i</i> = 0 if missing) having the definition <code>\TEXT</code> . Produces an error if <code>\FOO</code> already defined. Normally the command is defined to be <code>\long</code> (ie it may take multiple paragraphs in its argument). In the star-form, the command is not defined as <code>\long</code> and a blank line in any argument to the command would generate an error.
<code>\renewcommand</code>	<code>*{\FOO}[i]{\TEXT}</code>	Same as <code>\newcommand</code> , except it checks if <code>\FOO</code> already defined.
<code>\newenvironment</code>	<code>*{\FOO}[i]{\DEF1}{\DEF2}</code>	equivalent to: <code>\newcommand{\FOO}[i]{\DEF1} \def{\endFOO}{\DEF2}</code> (or the appropriate star forms).
<code>\renewenvironment</code>		Obvious companion to <code>\newenvironment</code> .
<code>\@cons</code>		: See description of <code>\output</code> routine.
<code>\@car</code>	<code>\@car T1 T2 ... Tn\@nil == T1</code>	(unexpanded)
<code>\@cdr</code>	<code>\@cdr T1 T2 ... Tn\@nil == T2 ... Tn</code>	(unexpanded)
<code>\typeout</code>	<code>{\message}</code>	Produces a warning message on the terminal.
<code>\typein</code>	<code>{\message}</code>	Types message, asks the user to type in a command, then executes it
<code>\typein</code>	<code>[\CS]{\MSG}</code>	Same as above, except defines <code>\CS</code> to be the input instead of executing it.
<code>\typein</code>

\@star@or@long Look ahead for a *. If present reset \l@ngrel@x so that the next definition, #1,
will be non-long.
47 \def\@star@or@long#1{%
48 \@ifstar
49 {\let\l@ngrel@x\relax#1}%
50 {\let\l@ngrel@x\long#1}}

```

`\l@ngrel@x` This is either `\relax` or `\long` depending on whether the `*`-form of a definition command is being executed.

```
51 \let\l@ngrel@x\relax
```

`\newcommand` User level `\newcommand`.

```
52 \def\newcommand{\@star@or@long\new@command}
```

`\new@command`

```
53 \def\new@command#1{%
54   \@testopt{\@newcommand#1}0}
```

`\@newcommand` Handling arguments for `\newcommand`.

```
\@argdef 55 \def\@newcommand#1[#2]{%
\@xargdef 56   \kernel@ifnextchar [{\@xargdef#1[#2]}%
57           {\@argdef#1[#2]}}
```

Define `#1` if it is definable.

Both here and in `\@xargdef` the replacement text is absorbed as an argument because if we are not allowed to make the definition we have to get rid of it completely.

```
58 \long\def\@argdef#1[#2]#3{%
59   \@ifdefinable #1{\@yargdef#1\@ne{#2}{#3}}}
```

Handle the second optional argument.

```
60 \long\def\@xargdef#1[#2] [#3]#4{%
61   \@ifdefinable#1{%
```

Define the actual command to be:

```
\def\foo{\@protected@testopt\foo\foo{default}}
```

where `\foo` is a csname generated from applying `\csname` and `\string` to `\foo`, ie the actual name contains a backslash and therefore can't clash easily with existing command names. "Default" is the contents of the second optional argument of `(re)newcommand`.

```
62   \expandafter\def\expandafter#1\expandafter{%
63     \expandafter
64     \@protected@testopt
65     \expandafter
66     #1%
67     \csname\string#1\endcsname
68     {#3}}%
```

Now we define the internal macro ie `\foo` which is supposed to pick up all arguments (optional and mandatory).

```
69   \expandafter\@yargdef
70   \csname\string#1\endcsname
71   \tw@
72   {#2}%
73   {#4}}}
```

`\@testopt` This macro encapsulates the most common call to `\@ifnextchar`, saving several tokens each time it is used in the definition of a command with an optional argument. `#1` The code to execute in the case that there is a `[` need not be a single token but can be any sequence of commands that 'expects' to be followed by `[`.

If this command were only used in `\newcommand` definitions then `#1` would be a single token and the braces could be omitted from `{#1}` in the definition below, saving a bit of memory.

```
74 \long\def\@testopt#1#2{%
75   \kernel@ifnextchar[#{#1}{#1[#{#2}]]}
```

`\@protected@testopt` Robust version of `\@testopt`. The extra argument (`#1`) must be a single token. If protection is needed the call expands to `\protect` applied to this token, and the 2nd and 3rd arguments are discarded (by `\@x@protect`). Otherwise `\@testopt` is called on the 2nd and 3rd arguments.

This method of making commands robust avoids the need for using up two csnames per command, the price is the extra expansion time for the `\ifx` test.

```
76 \def\@protected@testopt#1{%
77   \ifx\protect\@typeset@protect
78     \expandafter\@testopt
79   \else
80     \@x@protect#1%
81   \fi}
```

`\@yargdef` These generate a primitive argument specification, from a L^AT_EX [*<digit>*] form; `\@yargd@f` in fact *<digit>* can be anything such that `\number <digit>` is single digit.

Reorganised slightly so that `\renewcommand{\reserved@a}[1]{foo}` works. I am not sure this is worth it, as a following `\newcommand` would over-write the definition of `\reserved@a`.

Recall that L^AT_EX 2.09 goes into an infinite loop with `\renewcommand[1]{\@tempa}{foo}` (DPC 6 October 93).

Reorganised again (DPC 1999). Rather than make a loop to construct the argument spec by counting, just extract the required argument spec by using a delimited argument (delimited by the digit). This is faster and uses less tokens. The coding is slightly odd to preserve the old interface (using `#2 = \tw@` as the flag to surround the first argument with []). But the new method did not allow for the number of arguments `#3` not being given as an explicit digit; hence (further expansion of this argument and use of) `\number` was added later in 1999.

It is not clear why these are still `\long`.

```
82 \long \def \@yargdef #1#2#3{%
83   \ifx#2\tw@
84     \def\reserved@b##11{####1}}%
85   \else

151     \expandafter\@gobbletwo\string#2\endcsname
152     {\let#1#2}}

\providecommand \providecommand takes the same arguments as \newcommand, but discards them
if #1 is already defined, Otherwise it just acts like \newcommand. This imple-
mentation currently leaves any discarded definition in \reserved@a (and possibly

```

`\reserved@a`) this wastes a bit of space, but it will be reclaimed as soon as these scratch macros are redefined.

```
153 \def\providecommand{\@star@or@long\providecommand}
```

`\providecommand`

```
154 \def\providecommand#1{%
155   \begingroup
156   \escapechar\m@ne\xdef\@gtempa{\string#1}%
157   \endgroup
158   \expandafter\@ifundefined\@gtempa
159   {\def\reserved@a{\newcommand#1}}%
160   {\def\reserved@a{\renewcommand\reserved@a}}%
161   \reserved@a}%
```

`\CheckCommand` `\CheckCommand` takes the same arguments as `\newcommand`. If the command already exists, with the same definition, then nothing happens, otherwise a warning is issued. Useful for checking the current state before a macro package starts redefining things. Currently two macros are considered to have the same definition if they are the same except for different default arguments. That is, if the old definition was: `\newcommand\xxx[2][a]{(#1)(#2)}` then `\CheckCommand\xxx[2][b]{(#1)(#2)}` would *not* generate a warning, but, for instance `\CheckCommand\xxx[2]{(#1)(#2)}` would.

```
162 \def\CheckCommand{\@star@or@long\checkcommand}
```

`\CheckCommand` is only available in the preamble part of the document.

```
163 \@onlypreamble\CheckCommand
```

`\checkcommand`

```
164 \def\checkcommand#1#2#{\@check@c#1{#2}}
165 \@onlypreamble\checkcommand
```

`\@check@c` `\CheckCommand` itself just grabs all the arguments we need, without actually looking for [optional argument forms. Now define `\reserved@a`. If `\reserved@a` is then defined, compare it with the “`\#1`” otherwise compare `\reserved@a` with `\#1`.

```
166 \long\def\@check@c#1#2#3{%
167   \expandafter\let\csname\string\reserved@a\endcsname\relax
168   \renewcommand\reserved@a#2{#3}%
169   \@ifundefined{\string\reserved@a}%
170   {\@check@eq#1\reserved@a}%
171   {\expandafter\@check@eq
172     \csname\string#1\expandafter\endcsname
173     \csname\string\reserved@a\endcsname}}
174 \@onlypreamble\@check@c
```

`\@check@eq` Complain if `\#1` and `\#2` are not `\ifx` equal.

```
175 \def\@check@eq#1#2{%
176   \ifx#1#2\else
177     \latex@warning@no@line
178       {Command \noexpand#1 has
179        changed.\MessageBreak
180        Check if current package is valid}%
181   \fi}
182 \@onlypreamble\@check@eq
```

```

\@gobble The \@gobble macro is used to get rid of its argument.
\@gobbletwo 183 \long\def \@gobble #1{}
\@gobblefour 184 \long\def \@gobbletwo #1#2{}
185 \long\def \@gobblefour #1#2#3#4{}

\@backslashchar A category code 12 backslash.
193 \edef \@backslashchar{\expandafter \@gobble \string \}

```

11.4 Robust commands and protect

Fragile and robust commands are one of the thornier issues in L^AT_EX's commands. Whilst typesetting documents, L^AT_EX makes use of many of T_EX's features, such as arithmetic, defining macros, and setting variables. However, there are (at least) three different occasions when these commands are not safe. These are called 'moving arguments' by L^AT_EX, and consist of:

- writing information to a file, such as indexes or tables of contents.
- writing information to the screen.
- inside an `\edef`, `\message`, `\mark`, or other command which evaluates its argument fully.

The method L^AT_EX uses for making fragile commands robust is to precede them with `\protect`. This can have one of five possible values:

- `\relax`, for normal typesetting. So `\protect\foo` will execute `\foo`.
- `\string`, for writing to the screen. So `\protect\foo` will write `\foo`.
- `\noexpand`, for writing to a file. So `\protect\foo` will write `\foo` followed by a space.
- `\@unexpandable@protect`, for writing a moving argument to a file. So `\protect\foo` will write `\protect\foo` followed by a space. This value is also used inside `\edefs`, `\marks` and other commands which evaluate their arguments fully. More precisely, whenever the content of an `\edef` or `\xdef`

etc. can contain arbitrary user input not under the direct control of the programmer, one should use `\protected@edef` instead of `\edef`, etc., so that `\protect` has a suitable definition and the user input will not break if it contains fragile commands.

`\@unexpandable@protect`

```
194 \def\@unexpandable@protect{\noexpand\protect\noexpand}
```

`\DeclareRobustCommand` This is a package-writers command, which has the same syntax as `\newcommand`,
`\declare@robustcommand` but which declares a protected command. It does this by having

```
\DeclareRobustCommand\foo
define \foo to be \protect\foo<space>,
and then use \newcommand\foo<space>.
Since the internal command is \foo<space>, when it is written to an auxiliary
file, it will appear as \foo.
```

We have to be a bit cleverer if we're defining a short command, such as `_`, in order to make sure that the auxiliary file does not include a space after the command, since `_ a` and `_a` aren't the same. In this case we define `_` to be:

```
\x@protect\_ \protect\_<space>
```

which expands to:

```
\ifx\protect\@typeset@protect\else
  \x@protect\_
\fi
\protect\_<space>
```

Then if `\protect` is `\@typeset@protect` (normally `\relax`) then we just perform `_<space>`, and otherwise `\x@protect@` gobbles everything up and expands to `\protect_`.

Note: setting `\protect` to any value other than `\relax` whilst in 'typesetting' mode will cause commands to go into an infinite loop! In particular, setting `\protect` to `\@empty` will cause `_` to loop forever. It will also break lots of other things, such as protected `\ifmmodes` inside `\haligns`. If you really have to do such a thing, then please set `\@typeset@protect` to be `\@empty` as well. (This is what the code for `\patterns` does, for example.)

More fun with `\expandafter` and `\csname`.

```
195 \def\DeclareRobustCommand{\@star@or@long\declare@robustcommand}
196 \def\declare@robustcommand#1{%
197   \ifx#1\@undefined\else\ifx#1\relax\else
198     \@latex@info{Redefining \string#1}%

242 }
243 \def\restore@protect{\let\protect\@protect}

\protect The normal meaning of \protect
244 \set@typeset@protect

```

`\MakeRobust` This macro makes an existing fragile macro robust, but only if it hasn't been robust in the past, i.e., it checks for the existence of the macro `\<name>` and if that exists it assumes that `\<name>` is already robust. In that case either undefine the inner macro first or use `\DeclareRobustCommand` to define it in a robust way directly. We could probably test the top-level definition to have the right kind of structure, but this is somewhat problematical as we then have to distinguish between `\long` macros and others and also take into account that sometimes the top-level is deliberately done manually (like with `\begin`).

The macro firstly checks if the control sequence in question exists at all.

```

245 </2ekernel>
246 <latexrelease>\IncludeInRelease{2019/10/01}{\MakeRobust}{\MakeRobust}%
247 <*2ekernel | latexrelease>
248 \def\MakeRobust#1{%
249   \@ifundefined{\expandafter\@gobble\string#1}{%
250     \@latex@error{The control sequence '\string#1' is undefined!%
251       \MessageBreak There is nothing here to make robust}%
252     \@eha
253   }%

Then we check if the macro is already robust. We do this by testing if the internal
name for a robust macro is defined, namely \foo. If it is already defined do
nothing, otherwise set \foo equal to \foo and redefine \foo so that it acts like
a macro defined with \DeclareRobustCommand.

302 \latexrelease>\EndIncludeInRelease
303 \kernel)

```

`\kernel@make@fragile` The opposite of `\MakeRobust` except that it doesn't do many checks as it is internal to the kernel. Why does one want such a thing? Only for compatibility reasons if `latexrelease` requests a rollback of the kernel. For this reason we pretend that this command existed in all earlier versions of L^AT_EX i.e., we are not rolling it back since we need it precisely then. But we have to get it into the `latexrelease` file so that a roll forward is possible too.

```

304 \kernel)

319 \kernel | latexrelease>
320 \kernel)

```

11.5 Internal defining commands

These commands are used internally to define other L^AT_EX commands.

`\@ifundefined` Check if first arg is undefined or `\relax` and execute second or third arg depending,

```
321 </2ekernel>
322 <latexrelease>\IncludeInRelease{2018-04-01}{\@ifundefined}
323 <latexrelease>\Leave commands undefined in \@ifundefined}%
324 <*2ekernel|latexrelease>

Version using \ifcsname to avoid defining undefined tokens to \relax. Defined
here to simplify using unmatched \fi.

325 \def\@ifundefined#1{%
326   \ifcsname#1\endcsname\@ifundefin@d@i\else\@ifundefin@d@ii\fi{#1}}

327 \long\def\@ifundefin@d@i#1\fi#2{\fi
328   \expandafter\ifx\csname #2\endcsname\relax
329     \@ifundefin@d@ii
330   \fi
331   \@secondoftwo}

332 \long\def\@ifundefin@d@ii\fi#1#2#3{\fi #2}

Now test of engine.

333 \ifx\numexpr\@undefined
Classic version (should not be needed as etex is assumed).
334 \def\@ifundefined#1{%
335   \expandafter\ifx\csname#1\endcsname\relax
336     \expandafter\@firstoftwo
337   \else
338     \expandafter\@secondoftwo
339   \fi}
340 \else\ifx\directlua\@undefined
Use the \ifcsname defined above.
341 \else
Optimised version for LuaTeX, using \lastnamedcs
342 \def\@ifundefined#1{%
343   \ifcsname#1\endcsname
344     \expandafter\ifx\lastnamedcs\relax\else\@ifundefin@d@i\fi
345   \fi
346   \@firstoftwo}

347 \long\def\@ifundefin@d@i#1#2#3#4#5{#1#2#5}

348 \fi
349 \fi
350 </2ekernel|latexrelease>
351 <latexrelease>\EndIncludeInRelease
352 <latexrelease>\IncludeInRelease{0000-00-00}{\@ifundefined}
353 <latexrelease>\Leave commands undefined in \@ifundefined}%
354 <latexrelease>\def\@ifundefined#1{%
355 <latexrelease>   \expandafter\ifx\csname#1\endcsname\relax
356 <latexrelease>     \expandafter\@firstoftwo
357 <latexrelease>   \else
358 <latexrelease>     \expandafter\@secondoftwo
359 <latexrelease>   \fi}
360 <latexrelease>\EndIncludeInRelease
361 <*2ekernel>
```

`\@qend` The following define `\@qend` and `\@qrelax` to be the strings ‘end’ and ‘relax’ with the characters `\catcoded 12`.

```
362 \edef\@qend{\expandafter\@cdr\string\end\@nil}
363 \edef\@qrelax{\expandafter\@cdr\string\relax\@nil}
```

`\@ifnextchar` `\@ifnextchar` peeks at the following character and compares it with its first argument. If both are the same it executes its second argument, otherwise its third.

```
364 \long\def\@ifnextchar#1#2#3{%
365   \let\reserved@d=#1%
366   \def\reserved@a{#2}%
367   \def\reserved@b{#3}%
368   \futurelet\@let@token\@ifnch}
```

`\kernel@ifnextchar` This macro is the kernel version of `\@ifnextchar` which is used in a couple of places to prevent the AMS variant from being used since in some places this produced chaos (for example if an `fd` file is loaded in a random place then the optional argument to `\ProvidesFile` could get printed there instead of being written only in the log file. This happened when there was a space or a newline between the mandatory and optional arguments! It should really be fixed in the `amsmath` package one day, but...

Note that there may be other places in the kernel where this version should be used rather than the original, but variable, version.

```
369 \let\kernel@ifnextchar\@ifnextchar
```

`\@ifnch` `\@ifnch` is a tricky macro to skip any space tokens that may appear before the character in question. If it encounters a space token, it calls `xifnch`.

```
370 \def\@ifnch{%
371   \ifx\@let@token\@sptoken
372     \let\reserved@c\@xifnch
373   \else
374     \ifx\@let@token\reserved@d
375       \let\reserved@c\reserved@a
376     \else
377       \let\reserved@c\reserved@b
378     \fi
379   \fi
380   \reserved@c}
```

`\@sptoken` The following code makes `\@sptoken` a space token. It is important here that the control sequence `\:` consists of a non-letter only, so that the following whitespace is significant. Together with the fact that the equal sign in a `\let` may be followed by only one optional space the desired effect is achieved. NOTE: the following hacking must precede the definition of `\:` as math medium space.

```
381 \def\:{\let\@sptoken= } \: % this makes \@sptoken a space token
```

`\@xifnch` In the following definition of `\@xifnch`, `\:` is again used to get a space token as delimiter into the definition.

```
382 \def\:{\@xifnch} \expandafter\def\:{\futurelet\@let@token\@ifnch}
```

`\@ifstar` The new implementation below avoids passing the *⟨true code⟩* Through one more `\def` than the *⟨false code⟩*, which previously meant that `#` had to be written as `####` in one argument, but `##` in the other. The `*` is gobbled by `\@firstoftwo`.

```
383 \def\@ifstar#1{\@ifnextchar *{\@firstoftwo{#1}}}
```

```

\@dblarg
\@xdblarg 384 \long\def\@dblarg#1{\kernel@ifnextchar[{#1}]{\@xdblarg{#1}}}
385 \long\def\@xdblarg#1#2{#1[{#2}]{#2}}

\@sanitize The command \@sanitize changes the catcode of all special characters except
for braces to ‘other’. It can be used for commands like \index that want to write
their arguments verbatim. Needless to say, this command should only be executed
within a group, or chaos will ensue.

386 \def\@sanitize{\@makeother\ \@makeother\\\@makeother$\@makeother\&%
387 \@makeother\#\@makeother^\@makeother_\@makeother%\@makeother\~}

\@onelevel@sanitize This makes the whole “meaning” of #1 (its one-level expansion) into catcode 12
tokens: it could be used in \DeclareRobustCommand.
If it is to be used on default float specifiers, this should be done when they are
defined.

388 \def \@onelevel@sanitize #1{%
389 \edef #1{\expandafter\strip@prefix
390 \meaning #1}%
391 }

\makeatletter Make internal control sequences accessible or inaccessible.
\makeatother 392 \DeclareRobustCommand\makeatletter{\catcode'\@11\relax}
393 \DeclareRobustCommand\makeatother{\catcode'\@12\relax}

```

12 Discretionary Hyphenation

```

\@dischph
\@dischph Moved here to be after the definition of \DeclareRobustCommand.
The primitive \@dischph command adds a discretionary hyphen using the current font’s
\hyphenchar. Monospace fonts are usually declared with \hyphenchar set to −1
to suppress hyphenation.
LATEX, from LATEX 2.09 in 1986 defined \@dischph by

\def\@dischph{-}\discretionary{-}{-}{-}

```

The following comment was added when these commands were first set up, 19 April 1986:

the \@dischph command is redefined to allow it to work in the \ttfamily type style, where automatic hyphenation is suppressed by setting \hyphenchar to −1. The original primitive T_EX definition is saved as \@@hyph just in case anyone needs it.

L^AT_EX 2_ε, between 1993 and 2017, had a comment at this point saying that the definition “would probably change” because the definition always uses −. The definition used below was given in comments at this point during time.

In 2017 we finally enabled this definition by default, with the older L^AT_EX definition accessible via `latexrelease` as usual.

```

394 \if2\kernel
395 \ifx\latexrelease\IncludeInRelease{2017/04/15}\@dischph{-}\discretionary{-}{-}{-}\Use \hyphenchar in \@dischph%

```

Temporary definition of \@latex@info, final definition is later.

13 Counters

This section deals with counter and other variable allocation.

1 (*2ekernel)

The following are from plain T_EX:

\z@ A zero dimen or number. It's more efficient to write \parindent\z@ than
 \parindent 0pt.

\@ne The number 1.

\m@ne The number -1.

\tw@ The number 2.

\sixt@@n The number 16.

\@m The number 1000.

\@MM The number 20000.

\@xxxii The constant 32.

2 \chardef\@xxxii=32

\@Mi Constants 10001–10004.

\@Mii 3 \mathchardef\@Mi=10001

\@Miii 4 \mathchardef\@Mii=10002

\@Miv 5 \mathchardef\@Miii=10003

6 \mathchardef\@Miv=10004

\@tempcnta Scratch count registers used by L^AT_EX kernel commands.

\@tempcntb 7 \newcount\@tempcnta

8 \newcount\@tempcntb

\if@tempswa General boolean switch used by L^AT_EX kernel commands.

9 \newif\if@tempswa

\@tempdima Scratch dimen registers used by L^AT_EX kernel commands.

\@tempdimb 10 \newdimen\@tempdima

\@tempdimc 11 \newdimen\@tempdimb

12 \newdimen\@tempdimc

\@tempboxa Scratch box register used by L^AT_EX kernel commands.

13 \newbox\@tempboxa

\@tempskipa Scratch skip registers used by L^AT_EX kernel commands.

\@tempskipb 14 \newskip\@tempskipa

15 \newskip\@tempskipb

```

\@temptokena Scratch token register used by LATEX kernel commands.
16 \newtoks\@temptokena

14 Program control structure

This section defines a number of control structure macros, such as while-loops and for-loops.

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

```
1 (*2kernel)
2 \message{control,}

\@whilenum TEST \do {BODY}
\@whiledim TEST \do {BODY} : These implement the loop
    while TEST do BODY od
    where TEST is a TeX \ifnum or \ifdim test, respectively.
    They are optimized for the normal case of TEST initially false.

\@whilesw SWITCH \fi {BODY} : Implements the loop
    while SWITCH do BODY od
    Optimized for normal case of SWITCH initially false.

\@for NAME := LIST \do {BODY} : Assumes that LIST expands to
A1,A2,
    ... ,An .
    Executes BODY n times, with NAME = Ai on the i-th
iteration.
    Optimized for the normal case of n = 1. Works for n=0.

\@tfor NAME := LIST \do {BODY}
    if, before expansion, LIST = T1 ... Tn where each Ti is a
    token or {...}, then executes BODY n times, with NAME = Ti
    on the i-th iteration. Works for n=0.

NOTES: 1. These macros use no \@temp sequences.
        2. These macros do not work if the body contains anything that
        looks syntactically to TeX like an improperly balanced \if
        \else \fi.

\@whilenum TEST \do {BODY} ==
BEGIN
    if TEST
    then BODY
        \@iwhilenum{TEST \relax BODY}
    END

lterror.dtx

15 Error handling and tracing

This section defines L^AT_EX's error commands.

```
1 (*2ekernel)
```

The '2ekernel' code ensures that a `\usepackage{autoerr}` is essentially ignored if a 'full' format is being used that has the error messages already in the format.

These days we don't support autoloading approach any longer, but this part bit is kept in case it is used in old documents.

```
2 \expandafter\let\csname ver@autoerr.sty\endcsname\fmtversion
```

15.1 General commands

\MessageBreak This command prints a new-line inside a message, followed by a continuation line begun with `\@msg@continuation`. Normally it is defined to be `\relax`, but inside messages, it is let to `\@message@break`.

```
3 \let\MessageBreak\relax
```

\GenericInfo This takes two arguments: a continuation and a message, and sends the result to the log file.

```
4 \DeclareRobustCommand{\GenericInfo}[2]{%
5   \begingroup
6     \def\MessageBreak{^^J#1}%
7     \set@display@protect
8     \immediate\write\m@ne{#2\on@line.}%
9   \endgroup
10 }
```

\GenericWarning This takes two arguments: a continuation and a message, and sends the result to the screen.

```
11 \DeclareRobustCommand{\GenericWarning}[2]{%
12   \begingroup
13     \def\MessageBreak{^^J#1}%
14     \set@display@protect
15     \immediate\write\@unused{^^J#2\on@line.^^J}%
16   \endgroup
17 }
```

\GenericError This macro takes four arguments: a continuation, an error message, where to go for further information, and the help information. It displays the error message, and sets the error help (the result of typing `h` to the prompt), and does a horrible hack to turn the last context line (which by default is the only context line) into just three dots. This could be made more efficient.

```
18 \bgroup
19 \lccode'\@=' \ %
```

```

20 \lccode'\~=' \ %
21 \lccode'\}= ' \ %
22 \lccode'\{=' \ %
23 \lccode'\T=' \T%
24 \lccode'\H=' \H%
25 \catcode'\ =11\relax%
26 \lowercase{%
27 \egroup%

```

Unfortunately T_EX versions older than 3.141 have a bug which means that `^^J` does not force a linebreak in `\message` and `\errmessage` commands. So for these old T_EX's we use `\typeout` to produce the message, and then have an empty `\errmessage` command. This causes an extra line of the form

! .

To appear on the terminal, but if you do not like it, you can always upgrade your T_EX! In order for your format to use this version, you must define the macro `\@TeXversion` to be the version number, e.g., 3.14 of the underlying T_EX. See the comments in `ltdircheck.dtx`.

```

28 \dimen@{ifx\@TeXversion\@undefined4\else\@TeXversion\fi\p@%
29 \ifdim\dimen@>3.14\p@%

```

First the 'standard case'.

<pre> \PackageError \PackageWarning \PackageWarningNoLine \PackageInfo \ClassError \ClassWarning \ClassWarningNoLine \ClassInfo </pre>	<pre> \PackageError{<package>}{<error>}{<help>} \PackageWarning{<package>}{<warning>} \PackageWarningNoLine{<package>}{<warning>} \PackageInfo{<package>}{<info>} </pre>
--	--

and similarly for classes. The **Error** commands print the *<error>* message, and present the interactive prompt; if the author types **h**, then the *<help>* information is displayed. The **Warning** commands produce a warning but do not present the interactive prompt. The **WarningNoLine** commands do the same, but don't print the input line number. The **Info** commands write the message to the **log** file. Within the messages, the command **\MessageBreak** can be used to break a line, **\protect** can be used to protect command names, and **\space** is a space, for example:

```

\newcommand{\foo}{F00}
\PackageWarning{ethel}{%
  Your hovercraft is full of eels,\MessageBreak
  and \protect\foo\space is \foo}

```

produces:

```

Package ethel warning: Your hovercraft is full of eels,
(ethel)                and \foo is F00 on input line 54.

```

```

`\@badtab` Called by `\>`, `\+`, `\-` or `\<` when stepping to an undefined tab.

```

208 \gdef\@badtab{%
209   \latex@error{Undefined tab position}\@ehd}

```

`\@preamerr` This error is special: it appears in places where we normally have to `\protect` expansions. However, to prevent a protection of the error message itself (which would result in the message getting printed not issued on the terminal) we need to locally reset `\protect` to `\relax`.

```

210 \gdef\@preamerr#1{%
211   \begingroup
212     \let\protect\relax
213     \latex@error{\ifcase #1 Illegal character\or
214                 Missing @-exp\or Missing p-arg\fi\space
215                 in array arg}\@ehd
216   \endgroup}

```

`\@badlinearg` Occurs in `\line` and `\vector` command when a bad slope argument is encountered.

```

217 \gdef\@badlinearg{%
218   \latex@error{%
219       Bad \protect\line\space or \protect\vector
220       \space argument}\@ehb}

```

`\@parmoderr` Occurs in a float environment or a `\marginpar` when encountered in inner vertical mode.

```

221 \gdef\@parmoderr{%
222   \latex@error{Not in outer par mode}\@ehb}

```

`\@fltovf` Occurs in float environment or `\marginpar` when there are no more free boxes for storing floats.

```

223 \gdef\@fltovf{%
224   \latex@error{Too many unprocessed floats}\@ehb}

```

`\@latexbug` Occurs in output routine. This is bad news.

```

225 \gdef\@latexbug{%
226   \latex@error{This may be a LaTeX bug}{Call for help}}

```

`\@badcrerr` This error was removed and replaced by `\@nolnerr`.

```

227 %\def\@badcrerr {\latex@error{Bad use of \protect}\@ehc}

```

`\@noitemerr` `\addvspace` or `\addpenalty` was called when not in vmode. Probably caused by a missing `\item`.

```

228 \gdef\@noitemerr{%
229   \latex@error{Something's wrong--perhaps a missing %
230     \protect\item}\@ehc}

```

`\@notprerr` A command that can be used only in the preamble appears after the command `\begin{document}`.

```

231 \gdef\@notprerr{%
232   \latex@error{Can be used only in preamble}\@eha}

```

`\@inmatherr` Issued by commands that don't work correctly within math (like `\item`). There is no real error recovery happening, e.g., the user might get additional errors afterwards.

```

233 \gdef\@inmatherr#1{%
234   \relax
235   \ifmmode
236     \latex@error{Command \protect#1 invalid in math mode}\@ehc
237   \fi}

```

`\@invalidchar` An error for use with invalid characters. This is commented out, since we decided to use catcode 15 instead.

```

238 %\def\@invalidchar{\latex@error{Invalid character in input}\@ehc}

```

As well as the above error commands some error messages are directly coded to save space. The messages already present in $\text{\LaTeX}2.09$ include:

Environment --- undefined

Issued by `\begin` for undefined environment.

Tab overflow

Occurs in `\=` when maximum number of tabs exceeded.

\< in mid line

Occurs in `\<` when it appears in middle of line.

Float(s) lost

In output routine, caused by a float environment or `\marginpar` occurring in inner vertical mode.

15.3 Tracing

The **trace** package implements the commands `\traceon` and `\traceoff` that work similar to `\tracingall` but skip certain code blocks that produce a lot of tracing output being of no interest during debugging (for example loading a font). Code blocks that should be hidden during tracing need to be surrounded by the macros `\conditionally@traceoff` and `\contionally@traceon`.

For the kernel code the **trace** package then redefines a number of macros to include this tracing support.

However, in order to allow any macro package to react to `\traceon` we also provide dummy definitions for the two commands in the kernel so that they can be used by external packages without the need to distinguish between **trace** being loaded or not.

```
\conditionally@traceon  These are only dummy definitions. For details see the trace package.
\conditionally@traceoff 239 \let\conditionally@traceon\@empty
                        240 \let\conditionally@traceoff\@empty
                        241 </2ekernel>
```

File h

ltpar.dtx

16 Paragraphs

This section of the kernel declares the commands used to set `\par` and `\everypar` when ever their function needs to be changed for a long time.

16.1 Implementation

There are two situations in which `\par` may be changed:

- Long-term changes, in which the new value is to remain in effect until the current environment is left. The environments that change `\par` in this way are the following:
 - All list environments (itemize, quote, etc.)
 - Environments that turn `\par` into a noop: tabbing, array and tabular.
- Temporary changes, in which `\par` is restored to its previous value the next time it is executed. The following are all such uses.
 - `\end` when preceded by `\@endparenv`, which is called by `\endtrivlist`
 - The mechanism for avoiding page breaks and getting the spacing right after section heads.

`\@setpar` To permit the proper interaction of these two situations, long-term changes are made by the `\@setpar{<VAL>}` command. It's function is:

To set `\par`. It `\def`'s `\par` and `\@par` to `<VAL>`.

`\@restorepar` Short-term changes are made by the usual `\def\par` commands. The original values are restored after a short-term change by the `\@restorepar` commands.

`\@@par` `\@@par` always is defined to be the original `TEX` `\par`.

`\everypar` `\everypar` is changed only for the short term. Whenever `\everypar` is set non-null, it should restore itself to null when executed.

The following commands change `\everypar` in this way:

- `\item`
- `\end` when preceded by `\@endparenv`, which is called by `\endtrivlist`
- `\minipage`

When dealing with `\par` and `\everypar` remember the following two warnings:

1. Commands that make short-term changes to `\par` and `\everypar` must take account of the possibility that the new commands and the ones that do the restoration may be executed inside a group. In particular, `\everypar` is executed inside a group whenever a new paragraph begins with a left brace. The `\everypar` command that restores its definition should be local to the current group (in case the command is inside a minipage used inside someplace

where `\everypar` has been redefined). Thus, if `\everypar` is redefined to do an `\everypar{}` it could take several executions of `\everypar` before the restoration “holds”. This usually causes no problem. However, to prevent the extra executions from doing harm, use a global switch to keep anything harmful in the new `\everypar` from being done twice.

2. Commands that change `\everypar` should remember that `\everypar` might be supposed to set the following switches false:

- `@nobreak`
- `@minipage`

they should do the setting if necessary.

```
1 \*2kernel)
2 \message{par,}
```

`\@setpar` Initiate a long-term change to `\par`.

```
\@par 3 \def\@setpar#1{\def\par{#1}\def\@par{#1}}
```

The default definition of `\@par` will ensure that if `\@restorepar` defines `\par` to execute `\@par` it will redefine itself to the primitive `\@@par` after one iteration.

```
4 \def\@par{\let\par\@@par\par}
```

`\@restorepar` Restore from a short-term change to `\par`.

```
5 \def\@restorepar{\def\par{\@par}}
6 \*2kernel)
```

File i

ltspace.dtx

17 Spacing

This section deals with spacing, and line- and page-breaking.

17.1 User Commands

`\nopagebreak` [$\langle i \rangle$] : $\langle i \rangle = 0, \dots, 4$.
 Default argument = 4. Puts a penalty into the vertical list output as follows:
 0 : penalty = 0
 1 : penalty = `\@lowpenalty`
 2 : penalty = `\@medpenalty`
 3 : penalty = `\@highpenalty`
 4 : penalty = 10000
`\pagebreak` [$\langle i \rangle$] : same as except negatives of its penalty
`\linebreak` [$\langle i \rangle$] : analog of the above
`\nolinebreak` [$\langle i \rangle$] : analog of the above
`\samepage` : inhibits page breaking most places by setting the following penalties to 10000:
`\interlinepenalty`
`\postdisplaypenalty`
`\interdisplaylinepenalty`
`\@beginparpenalty`
`\@endparpenalty`
`\@itempenalty`
`\@secpenalty`
`\interfootnotelinepenalty`
`\` : initially defined to be `\newline`
`\` [$\langle length \rangle$] : initially defined to be `\vspace{\langle length \rangle}\newline`
 Note: `\`* adds a `\adjust{\penalty 10000}`
 OBSOLETE COMMANDS (which never made it into the manual):
`\obeycr` : defines `\CRi` == `\`
`\restorecr` : restores `\CRi` to its usual meaning.

17.2 Chris' comments

There are several aspects of the handling of space in horizontal mode that are inconsistent or do not work well in some cases. These are largely concerned with ignoring the effect of space tokens that would otherwise typeset an inter-word space.

Negating the effect of such space tokens is achieved by two mechanisms:

- `\unskip` is used to remove the glue just added by a space that has already had its effect; it is sometimes invoked after an `\ifdim` test on `\lastskip` (see below);
- `\ignorespaces` is used to ignore space-tokens yet to come.

The test done on `\lastskip` is sometimes for equality with zero and sometimes for being positive. Recall also that the test is only on the natural length of the glue and that no glue cannot be distinguished from glue whose natural length is zero: to summarise, a pretty awful test. It is not clear why these tests are not all the same; I think that they should all be for equality. One place where `\unskip` is often used is just before a `\par` (which itself internally does an `\unskip`) and one bit of code (in `\@item`) even has two `\unskips` before a `\par`. These uses may be fossil code but if they are necessary, maybe `\@killglue` would be even safer.

Such removal of glue by `\unskip` may sometimes have the wrong result, removing not the glue from a space-token but other explicit glue; this is sometimes not what is intended.

A common way to prevent such removal is to add an `\hskip\z@` after the glue that should not be removed. This protects that glue against one `\unskip` with no test but not against more than one. It does work for ‘tested `\unskips`’. This is used by `\hspace*` but not by `\hspace`; this is inconsistent as the star is supposed to prevent removal only at the beginning of a line, not at the end, or in a tabular, etc.

If this reason for removing glue were the only consideration then a tested-`\unskip` and protection by `\hskip\z@` would suffice but would need to be consistently implemented.

However, the class of invisibles, commands and environments tries to be even cleverer: one of these tries to leave only one inter-word space whenever there is one before it and one after it; and it does this quite well.

But problems can arise when there is not a space-token on both sides of it; in particular, when an invisible appears at the beginning or end of a piece of text the method still leaves one space token whereas usually in these cases it should leave none.

Also, the current rules do not work well when more than one such command appears consecutively, separated by space-tokens; it leaves glue between every other invisible.

There is also a question about what these commands should do when they occur next to spaces that do not come from space tokens but, for example, from `\hspace`. Should they still produce ‘just one space’? If so, which one? It is good to note that the manual is sufficiently cautious about invisibles that we are not obliged to make anything work.

Another interesting side-road to explore is whether the space-tokens either side of an `\hspace{...}` should be ignored.

One alternative to the current algorithm that is often suggested is that all glue around the invisible should be consolidated into a space after it (usually without stating how much glue should be put there). The command `\nolinebreak` is implemented this way (and `\linebreak` should also be). This does not work correctly for the following common case:

```
... some text
\index{some-word}
some-word and more text.
```

This is optimal coding since it is normal to index a word that gets split across a page-break on its starting page. This would, on the other hand, fix another common (and documented) failure of the current system: when the invisible is

the last thing in a paragraph the space before it is not removed and, worse, it is also hidden from the paragraph-ending mechanism so that an ‘empty’ line can be created at the end of the paragraph.

Another deficiency (I think) of the current system is that the following is treated as having the `\index` command between the paragraphs, which is probably not what the author intended (since there is no empty line after it).

```
\index{beginnings}
Beginnings of paragraphs ...
```

I know of no algorithm that will handle satisfactorily even all the most common cases; note that it could be that the best algorithm may be different for different invisibles since, for example, the common uses and expected behaviour of `\index`, `\marginpar`, `\linebreak`, `\pagebreak` and `\vspace` are somewhat different. [For example, is `\vspace` ever used in the middle of a paragraph?]

One method that can (and is) used to make invisible commands produce no space when used at the beginning of text is to put in some glue that is nearly enough the same as no glue or glue of zero length in all respects except for the precise test for not being exactly equal to zero; examples of such glue are `\hskip 1sp` and, possibly better but more complex, `\hskip -1sp \hskip 1sp`. However, this only works when it is known that user-supplied text is about to start.

Some similar concerns apply to the handling of space and penalties in vertical mode; there is an extra hurdle here as `\unskip` does not work on the main vertical list. The complexity of the tests done by `\addvspace` have never been explained.

The implementation of space hacks etc for vertical mode is another major area that needs further attention; my earlier experiments did not produce much improvement over the current unsatisfactory situation.

One particular problem is what happens when the following very natural coding is used (part of the problem here is that this looks like an hmode problem, but it is not):

```
... end of text.

\begin{enumerate}
  \item \label{item:xxx} Item text.
\end{enumerate}
```

17.3 Some immediate actions

- Fix bug in `\linebreak`.
- Fix bug in `*`.
- Reimplement `\\`, etc, removing extra `\vadjusts` and getting better error trapping (this seems to involve a lot more tokens).
- Investigate whether `\\`, etc need to be errors in vmode; I think that they could be noops (maybe with a warning).
- Make all(?) `\unskips` include test for zero skip (rather than other tests or no test).

- Consider replacing `\hskip 1sp` by something better (here called an ‘infinitesimal’ skip).
- Look at all `\hskip\z@` (or similar) to see if they should be changed to an ‘infinitesimal’ skip.
- Resolve the inconsistency between `\hspace` and `\hspace*`.
- Remove unnecessary `\unskips`.
- Investigate and rationalise the ‘newline’ code.
- Find better algorithms for all sorts of things or, easier(?), fix T_EX itself.

17.4 The code

```

`\` The purpose of the new code is to fix a few bugs; however, it also attempts to optimize the following, in order of priority:

1. efficient execution of plain `\`;
2. efficient execution of `\[...]`;
3. memory use;
4. name-space use.

The changes should make no difference to the typeset output. It appears to be safe to use `\reserved@e` and `\reserved@f` here (other reserved macros are somewhat disastrous).

These changes made `\newline` even less robust than it had been, so now it is explicitly robust, like `\`.

`\@normalcr` The internal definition of the ‘normal’ definition of `\`.

```

`\if@nobreak` Switch used to avoid page breaks caused by `\label` after a section heading, etc. It should be **GLOBALLY** set true after the `\nobreak` and **globally** set false by the next invocation of `\everypar`.

Commands that reset `\everypar` should globally set it false if appropriate.

```
94 \def\@nobreakfalse{\global\let\if@nobreak\iffalse}
95 \def\@nobreaktrue {\global\let\if@nobreak\iftrue}
96 \@nobreakfalse

```

`\@savsk` Registers used to save the space factor and last skip.
`\@savsf` 97 `\newdimen\@savsk`
98 `\newcount\@savsf`

`\@bsphack` `\@bsphack` and `\@esphack` used by macros such as `\index` and `\begin{@float}` ... `\end{@float}` that want to be invisible — i.e., not leave any extra space when used in the middle of text. Such a macro should begin with `\@bsphack` and end with `\@esphack`. The macro in question should not create any text, nor change the mode.

Before giving the current definition we give an extended definition that is currently not used (because it doesn't work as advertised:-)

These are generalised hacks which attempt to do sensible things when 'invisible commands' appear in vmode too.

They need to cope with space in both hmode (plus spacefactor) and vmode, and also cope with breaks etc. In vmode this means ensuring that any following `\addvspace`, etc sees the correct glue in `\lastskip`.

In fact, these improved versions should be used for other cases of 'whatsits, thingies etc' which should be invisible. They are only for commands, not environments (see notes on `\@Esphack`).

BTW, anyone know why the standard hacks are surrounded by `\ifmmode\else` rather than simply `\ifhmode`?

And are there any cases where saving the spacefactor is essential? I have some extensions where it is, but it does not appear to be so in the standard uses.

```
\def \@bsphack{%
  \relax \ifvmode
    \@savsk \lastskip
    \ifdim \lastskip=\z@
      \else
        \vskip -\lastskip
      \fi
    \else
      \ifhmode
        \@savsk \lastskip
        \@savsf \spacefactor
      \fi
    \fi
}
```

I think that, in vmode, it is the safest to put in a `\nobreak` immediately after such things since writes, inserts etc followed by glue give valid breakpoints and, in general, it is possible to create breaks but impossible to destroy them.

```
\def \@esphack{%
  \relax \ifvmode
    \nobreak
    \ifdim \@savsk=\z@
      \else
        \vskip\@savsk
      \fi
    \else
      \ifhmode
        \spacefactor \@savsf
      \fi
    \fi
}
```

```

        \ifdim \@savsk>\z@
        \ignorespaces
        \fi
    \fi
\fi
}

```

For the moment we are going to ignore the vertical versions until they are correct.

```

99 \def\@bsphack{%
100 \relax
101 \ifhmode
102 \savsk\lastskip
103 \savsf\spacefactor
104 \fi}

```

\@esphack Companion to \@bsphack. If this command is not properly paired with \@bsphack one might end up with a low-level T_EX error: “BAD spacefactor”. One possible cause is calling \@bsphack in vertical mode, then doing something that gets you (sometimes) into horizontal mode and finally calling \@esphack. Even if no error is generated that is wrong, because \@esphack will then use the saved values for \@savsk and \@savsf from some earlier invocation of \@bsphack which will have nothing to do with the current situation.

```

`\@vbsphack` Another variant which is useful for invisible things which should not live in vmode (this is how some people feel about marginals).

If it occurs in vmode then it enters hmode and ensures that `\@savsk` is nonzero so that the `\ignorespaces` is put in later. It is not used at present.

```

\def \@vbsphack{ %
  \relax \ifvmode
    \leavevmode
    \@savsk 1sp
    \@savsf \spacefactor
  \else
    \ifhmode
      \@savsk \lastskip
      \@savsf \spacefactor
    \fi
  \fi
}

```

17.5 Vertical spacing

L^AT_EX supports the plain T_EX commands `\smallskip`, `\medskip` and `\bigskip`. However, it redefines them using `\vspace` instead of `\vskip`.

Extra vertical space is added by the command `\addvspace{<skip>}`, which adds a vertical skip of *<skip>* to the document. The sequence `\addvspace{<s1>} \addvspace{<s2>}` is equivalent to `\addvspace{<maximum of s1, s2>}`.

`\addvspace` should be used only in vertical mode, and gives an error if it's not. The `\addvspace` command does *not* add vertical space if `@minipage` is true. The minipage environment uses this to inhibit the addition of extra vertical space at the beginning.

Penalties are put into the vertical list with the `\addpenalty{<penalty>}` command. It works properly when `\addpenalty` and `\addvspace` commands are mixed.

The `@nobreak` switch is set true used when in vertical mode and no page break should occur. (Right now, it is used only by the section heading commands to inhibit page breaking after a heading.)

```

\addvspace{SKIP} ==
BEGIN
  if vmode
    then if @minipage
      else if \lastskip =0

```

```

        then \vskip SKIP
      else if \lastskip < SKIP
        then \vskip -\lastskip
             \vskip SKIP
        else if SKIP < 0 and \lastskip >= 0
          then \vskip -\lastskip
               \vskip \lastskip + SKIP
        fi
      fi
    fi
  else useful error message (CAR).
fi
END

```

\@xaddvskip Internal macro for \vspace handling the case that space has previously been added.

```

193 \def\@xaddvskip{%
194   \ifdim\lastskip<\@tempskipb

`\vspace` The new code for these commands depends on the following facts:

`\@vspace`
`\@vspacer`

- The value of `prevdepth` is changed only when a box or rule is created and added to a vertical list;
- The value of `prevdepth` is used only when a box is created and added to a vertical list;
- The value of `prevdepth` is always local to the building of one vertical list.

```

17.6 Horizontal space (and breaks)

`\nobreakdashes` This idea is borrowed from the `amsmath` package but here we define a robust command.

This command is a low-level command designed for use only before hyphens or dashes (such as `-`, `--`, or `---`).

It could probably be better implemented: it may need its own private token register and temporary command.

Setting the hyphen in a box and then unboxing it means that the normal penalty will not be added after it—and if the penalty is not there a break will not be taken (unless an explicit penalty or glue follows, thus the final `\nobreak`).

Note that even if it is not followed by a `'-`, it still leaves `vmode` and sets the `spacefactor`; so use it carefully!

```

316 \DeclareRobustCommand{\nobreakdashes}{%
317   \leavevmode
318   \toks@{}%

```

`\nobreakspace` This is a robust command that produces a horizontal space at which, in paragraph-mode, a line-break is not possible. We then define an active `~` to expand to it since this is the documented behaviour of `~`. One reason for introducing this is that some 8-bit input encodings have a slot for such a space and we do not want to use active characters as the \LaTeX internal commands.

The braces in the definition of `~` are needed to ensure that a following space is preserved when reading to/from internal files.

We need to keep `\@xobeysp` as it is widely used; so here it is let to the non-robust command `\nobreakspace`.

```

330 \DeclareRobustCommand{\nobreakspace}{%
331   \leavevmode\nobreak\ }
332 \catcode '\~ =13
333 \def~{\nobreakspace}
334 \expandafter\let\expandafter\@xobeysp\csname nobreakspace \endcsname

```

`\,` Used in paragraph mode produces a `\thinspace`. It has the ordinary definition in math mode. Useful for quotes inside quotes, as in ‘‘`\,`‘Foo’, he said.’’

```
335 \DeclareRobustCommand{\,}{%
336   \relax\ifmmode\mskip\thinmuskip\else\thinspace\fi
337 }
```

`\@` Placed before a ‘.’, makes it a sentence-ending period. Does the right thing for other punctuation marks as well. Does this by setting spacefactor to 1000.

ltxfiles.dtx

19 File Handling

The following user commands are defined in this part:

<code>\document</code>	<code>(ie \begin{document})</code> Reads in the .AUX files and <code>\catcode</code> 's @ to 12.
<code>\nofiles</code>	Suppresses all file output by setting <code>\@filesw</code> false.
<code>\includeonly</code>	<code>{\NAME1, ... ,NAMEn}</code> Causes only parts NAME1, ... ,NAMEn to be read by their <code>\include</code> commands. Works by setting <code>partsw</code> true and setting <code>\@partlist</code> to NAME1, ... ,NAMEn.
<code>\include</code>	<code>{\NAME}</code> Does an <code>\input</code> NAME unless <code>\@partsw</code> is true and NAME is not in <code>\@partlist</code> . If <code>\@filesw</code> is true, then it directs .AUX output to NAME.AUX, including a checkpoint at the end.
<code>\input</code>	<code>{\NAME}</code> The same as TeX's <code>\input</code> , except it allows optional braces around the file name. In $\text{\LaTeX 2}_{\epsilon}$, it also avoids the primitive 'missing file' error, if the file can not be found.
<code>\IfFileExists</code>	<code>{\NAME}{\<then>}{\<else>}</code> If the file exists on the system, execute <i>then</i> otherwise execute <i>else</i> .
<code>\InputIfFileExists</code>	<code>{\NAME}{\<then>}{\<else>}</code> If the file exists on the system, execute <i>then</i> and input NAME otherwise execute <i>else</i> . <i>Historical \LaTeX 2.09 comments (not necessarily accurate any more):</i>

```

2 \message{files,}
```

VARIABLES, SWITCHES AND INTERNAL COMMANDS:

`\@mainaux` : Output file number for main .AUX file.
`\@partaux` : Output file number for current part's .AUX file.
`\@auxout` : Either `\@mainout` or `\@partout`, depending on which .AUX file output goes to.
`\@input{foo}` : If file foo exists, then `\input`'s it, otherwise types a warning message.
`@filesw` : Switch – set false if no .AUX, .TOC, .IDX etc files are to be written
`@partsw` : Set true by a `\includeonly` command.
`\@partlist` : Set to the argument of the `\includeonly` command.
`\cp@F00` : The checkpoint for `\include`'d file FOO.TEX, written by `\@writeckpt` at the end of file FOO.AUX

37 \fi

```

Dateline 1991/03/26: FMi added `\process@table` to support NFSS; This will also work with old lfonts if no other style defines `\process@table`. The following line forces the initialization of the math fonts.

```

38   \process@table
39   \let\glb@currsizel@empty % Force math initialization.

40   \normalsize
41   \everypar{}%

```

So that punctuation in headings is not disturbed by verbatim or other local changes to the space factor codes, save the document default here. This will be locally reset by the output routine. For special cases a class may want to define `\normalsfcodes` directly, in case that definition will be used. (This is an old bug, problem existed in L^AT_EX 2.0x and plain T_EX.)

```

42   \ifx\normalsfcodes\@empty
43     \ifnum\sfcode'\.=\@m
44       \let\normalsfcodes\frenchspacing
45     \else
46       \let\normalsfcodes\nonfrenchspacing
47   \fi
48 \fi

```

For similar reasons also save the default language, this will be reset locally in the output routine. In particular it allows hyphenation in the page head even if the page break happens in verbatim. If this has already been set by a package, set to the value of `\language` at this point.

```

49   \ifx\document@default@language\m@ne
50     \chardef\document@default@language\language
51   \fi

```

Way back in 1991 (08/26) FMi & RmS set the `\@noskipsec` switch to true in the preamble and to false here. This was done to trap lists and related text in the preamble but it does not catch everything; hence Change 1.1g was introduced.

```

52   \@noskipsecfalse

53   \let \@refundefined \relax

```

Just before disabling the preamble commands we execute the begin document hook which contains any code contributed by `\AtBeginDocument`. Also disable the gathering of the file list, if no `\listfiles` has been issued. `\AtBeginDocument` is redefined at this point so that and such commands that get into the hook do not chase their tail...

```

54   \let\AtBeginDocument\@firstofone
55   \@begindocumenthook

```

Most of the following assignments will be done globally in case the user adds something like `\begin{multicols}` to the document hook, i.e. starts are group in `\begin{document}`.

Since a value of exactly 0pt for `\topskip` causes `\twocolumn[]` to misbehave, we add this check, hoping that it will not cause any problems elsewhere.

```

56 \ifdim\topskip<1sp\global\topskip 1sp\relax\fi
57 \global\@maxdepth\maxdepth
58 \global\let\@begindocumenthook\@undefined
59 \ifx\@listfiles\@undefined
60   \global\let\@filelist\relax
61   \global\let\@addtofilelist\@gobble
62 \fi

```

At the very end we disable all preamble commands. This has to happen after the begin document hooks was executed so that this hook can still use such commands.

```

63 \gdef\do##1{\global\let ##1\@notprerr}%
64 \@preamblecmds

```

The next line saves tokens and also allows `\@nodocument` to be used directly to trap preamble errors.

```

65 \global\let \@nodocument \relax

```

The next line is a pure safety measure in case a do list is ever expanded at the wrong place. In addition it will save a few tokens to get rid of the above definition.

```

66 \global\let\do\noexpand

```

Use of `\AtBeginDocument` hook might mean that we are already in horizontal mode, so ignore the space after `\begin{document}`.

19.1 Safe Input Macros

`\@curr@file` File name handling is done by generating a `csname` from the provided file name
`\set@curr@file` (which means that UTF-8 octets gets turned into strings as this is what happens if they appear in a `csname` due to the code in `utf8.def`). By setting `\escapechar` to `-1` we ensure that we don't get a backslash in front. As a result we end up with all characters as catcode 12 (plus spaces). We then sometimes add quotes around the construct (removing any existing inner quotes. Sometimes we only remove the quotes if they have been supplied by the user. There is clearly some room for improvement.

A side effect of the new code is that we will see quotes around file name displays where there haven't been any before.

For compatibility with existing code using `{abc}.tex` or `{one.two}.png` an initial brace group is discarded before expansion and `\string` is applied. The content of the brace group is discarded. This means that a leading space will be lost unless protected (by `{ }` or `" "` or `\space`) but filenames with a space are hopefully rare.

380 \reserved@a
381 \fi}

```

\@obsoletefile For compatibility with L^AT_EX 2.09 document styles, we distribute files called `article.sty`, `book.sty`, `report.sty`, `slides.sty` and `letter.sty`. These use the command `\@obsoletefile`, which produces a warning message.

```

382 \def\@obsoletefile#1#2{%
383 \latex@warning@no@line{inputting ‘#1’ instead of obsolete ‘#2’}}
384 \@onlypreamble\@obsoletefile

```

19.2 Listing files

\@filelist A list of files input so far. The initial value of `\@gobble` eats the comma before the first file name.

```

385 \let\@filelist\@gobble

```

\@addtofilelist Add to the list of files input so far. This ‘real’ definition is only used for ‘cfg’ files during `initex`. An initial definition of `\@gobble` has already been set.

```

386 %\def\@addtofilelist#1{\xdef\@filelist{\@filelist,#1}}

```

\listfiles A preamble command to cause `\end{document}` to list files input from the main file.

```

387 \def\listfiles{%
388 \let\listfiles\relax
389 \def\@listfiles##1##2##3##4##5##6##7##8##9\@{%
390 \def\reserved@d{\}%
391 \@tfor\reserved@c:=##1##2##3##4##5##6##7##8\do{%
392 \ifx\reserved@c\reserved@d
393 \edef\filename@area{ \filename@area}%
394 \fi}}%

395 \def\@dofilelist{%
396 \typeout{^^J *File List*}%
397 \@for\@currname:=\@filelist\do{%
398 \filename@parse\@currname
399 \edef\reserved@a{%
400 \filename@base.%
401 \ifx\filename@ext\relax tex\else\filename@ext\fi}%
402 \expandafter\let\expandafter\reserved@b
403 \csname ver@\reserved@a\endcsname
404 \expandafter\expandafter\expandafter\@listfiles\expandafter
405 \filename@area\filename@base\////////////////////////////////\@
406 \typeout{%
407 \filename@area\reserved@a
408 \ifx\reserved@b\relax\else\@spaces\reserved@b\fi}}%
409 \typeout{ *****^^J}}

```

The `\@filelist` will be de-activated if `\listfiles` does not appear in the preamble. `\begin{document}` contains code equivalent to the following:

```
\AtBeginDocument{%
  \ifx\@listfiles\@undefined
    \let\@filelist\relax
    \let\@addtofilelist\@gobble
  \fi}

410 \@onlypreamble\listfiles

\@dofilelist

411 \let\@dofilelist\relax

412 \end{kernel}
```

File 1

ltoutenc.dtx

20 Font encodings

This section of the kernel contains commands for declaring encoding-specific commands, such as accents. It also contains the code for some of the encoding files, including `omlenc.def`, `omsenc.def`, `t1enc.def` and `ot1enc.def` files, which define the OLM, OMS, T1 and OT1 encodings, and the `fontenc` package for selecting encodings.

The `fontenc` package has options for encodings, of which the last option is the default encoding. For example, to use the OT2, OT3 and T1 encodings, with T1 as the default, you say:

```
\usepackage[OT2,OT3,T1]{fontenc}
```

The standard kernel set-up loads font encoding files and selects an encoding as follows.

```
\input {omlenc.def}
\input {t1enc.def}
\input {ot1enc.def}
\input {omsenc.def}
\fontencoding{OT1}
```

Note that the files in the standard `inputenc` package depend on this behaviour of the kernel.

The syntax for declaring encoding-specific commands is:

```
\DeclareTextCommand{<command>}{<encoding>}
                        [<number>] [<default>] {<commands>}
```

This command is like `\newcommand`, except that it defines a command which is specific to one encoding. The resulting command is always robust, even if its definition is fragile. For example, the definition of `\l` in the OT1 encoding is:

```
\DeclareTextCommand{\l}{OT1}{\@xxxii l}
```

`\DeclareTextCommand` takes the same optional arguments as `\newcommand`.

```
\ProvideTextCommand{<command>}{<encoding>}
                        [<number>] [<default>] {<commands>}
```

This acts like `\DeclareTextCommand`, but does nothing if the command is already defined.

```
\DeclareTextSymbol{<command>}{<encoding>}{<slot>}
```

This command defines a text symbol, with a particular slot in that encoding. The commands:

```
\DeclareTextSymbol{\ss}{OT1}{25}
\DeclareTextCommand{\ss}{OT1}{\char25 }
```

have the same effect, but the `\DeclareTextSymbol` is faster.

```
\DeclareTextAccent{<command>}{<encoding>}{<slot>}
```

This command declares a text accent. The commands:

```
\DeclareTextAccent{"}{OT1}{127}
\DeclareTextCommand{"}{OT1}{\add@accent {127}}
```

have the same effect.

```
\DeclareTextComposite{<command>}{<encoding>}{<argument>}{<slot>}
```

This command declares a composite letter, for example in the T1 encoding `\'a` is slot 225, which is declared by:

```
\DeclareTextComposite{\'}{T1}{a}{225}
```

The *command* will normally have been declared with `\DeclareTextAccent`, or as a one-argument `\DeclareTextCommand`.

`\DeclareTextComposite` is the most common example of using the more general declaration `\DeclareTextCompositeCommand`, which can define a composite to be an arbitrary piece of text.

```
\DeclareTextCompositeCommand{<command>}{<encoding>}{<argument>}{<text>}
```

For example, in the OT1 encoding Å has a hand-crafted definition this is declared as follows

```
\DeclareTextCompositeCommand{\r}{OT1}{A}
{\leavevmode\setbox\z@\hbox{!}\dimen@ \ht\z@\advance\dimen@-1ex%
\rlap{\raise.67\dimen@\hbox{\char23}}A}
```

The *command* will normally have been declared with `\DeclareTextAccent`, or as a one-argument `\DeclareTextCommand`.

The commands defined using the above declarations can be used in two ways. Normally they are used by just calling the command in the appropriate encoding, for example `\ss`. However, sometimes you may wish to use a command in an encoding where it is not defined. If the command has no arguments, then you can use it in another encoding by calling `\UseTextSymbol`:

```
\UseTextSymbol{<encoding>}{<command>}
```

For example, `\UseTextSymbol{OT1}{\ss}` has the same effect as:

```
{\fontencoding{OT1}\selectfont\ss}
```

If the command has one argument then you can use it in another encoding by calling `\UseTextAccent`:

```
\UseTextAccent{<encoding>}{<command>}{<text>}
```

For example, if the current encoding is OT2 then `\UseTextAccent{OT1}{\'a}` has the same effect as:

```
{\fontencoding{OT1}\selectfont\'{\fontencoding{OT2}\selectfont a}}
```

You can also declare a default definition for a text command, which will be used if the current encoding has no appropriate definition. Such use will also set the definition for this command in the current encoding to equal this default definition; this makes subsequent uses of the command much faster.

```
\DeclareTextCommandDefault{<command>}{<definition>}
```

For example, the default definition of the command `\textonequarter` (which produces the fraction $\frac{1}{4}$) could be built using math mode:

```
\DeclareTextCommandDefault{\textonequarter}{\ensuremath {\frac{1}{4}}}
```

There is a matching `\Provide` command which will not override an existing default definition:

```
\ProvideTextCommandDefault{<command>}{<definition>}
```

The most common use for these commands is to use symbols from other encodings, so there are some optimizations provided:

```
\DeclareTextSymbolDefault{<command>}{<encoding>}
\DeclareTextAccentDefault{<command>}{<encoding>}
```

are short for:

```
\DeclareTextCommandDefault{<command>}
      {\UseTextSymbol{<encoding>}{<command>}}
\DeclareTextCommandDefault[1]{<command>}
      {\UseTextAccent{<encoding>}{<command>}{#1}}
```

For example, to make OT1 the default encoding for `\ss` and `\'` you say:

```
\DeclareTextSymbolDefault{\ss}{OT1}
\DeclareTextAccentDefault{\'}{OT1}
```

Note that you can use these commands on any zero- or one-argument commands declared with `\DeclareText*` or `\ProvideText*`, not just those defined using `\DeclareTextSymbol` or `\DeclareTextAccent`.

20.1 Removing encoding-specific commands

In some cases encoding definitions are given to provide some limited support since nothing better is available, for example, the definition for `\textdollar` in OT1 is a hack since \$ and £ actually share the same slot in this encoding. Thus if such a glyph becomes available in a different encoding (e.g., TS1) one would like to get rid of the flaky one and make the default definition point to the new encoding. In such a case defining

```
\DeclareTextSymbol{\textdollar}{TS1}{36}
\DeclareTextSymbolDefault{\textdollar}{TS1}
```

is not enough since if typesetting in OT1 L^AT_EX will still find the encoding specific-definition for OT1 and therefore ignore the new default. Therefore to ensure that in this case the TS1 version is used we have to remove the OT1 declaration:

```
\UndeclareTextCommand{\textdollar}{OT1}
```

Since the \$ sign is a proper glyph in the T1 encoding there is no point removing its definition and forcing L^AT_EX to pick up the TS1 version if typesetting in this encoding. However, assume you want to use the variant dollar sign, i.e., \$ for your dollars. In that case you have to get rid of the T1 declaration as well, e.g., the following would do that for you:

```
\UndeclareTextCommand{\textdollar}{OT1}
\UndeclareTextCommand{\textdollar} {T1}
\DeclareTextCommandDefault{\textdollar}
{\UseTextSymbol{TS1}\textdollaroldstyle}
```

20.2 The order of declarations

If an encoding-specific command is defined for more than one encoding, then it will execute fastest in the encoding in which it was defined last since its top-level definition will be set up to execute in that encoding without any overhead.

For this reason the file `fonttext.ltx` currently first loads the definitions for the T1 encoding and then those for the OT1 encoding so that typesetting in OT1 is optimized since that is (still) the default. However, when T1 is explicitly requested (via `\usepackage[T1]{fontenc}`) the top-level definitions are automatically changed to favour T1 since its declarations are reloaded in the process.

For the same reason default declarations should never come last since they are implemented as a special encoding themselves (with the name ?). Specifying them last would simply mean to make those encoding-specific commands equally inefficient in all encodings. Therefore the `textcomp` package, for example, first sets up all defaults to point to TS1 and then declares the commands in the TS1 encoding.

20.3 Docstrip modules

This `.dtx` file is be used to generate several related files containing font encoding definitions. The mutually exclusive docstrip options are listed here.

T1	generates <code>t1enc.def</code> for the Cork encoding.
TS1	generates <code>ts1enc.def</code> for the Text Companion encoding.
TS1sty	generates <code>textcomp.sty</code> , package that sets up use of the Text Companion encoding.
OT1	generates <code>ot1enc.def</code> for Knuth's CM encoding.
OMS	generates <code>omsenc.def</code> for Knuth's math symbol encoding.
OML	generates <code>omlenc.def</code> for Knuth's math letters encoding.
OT4	generates <code>ot4enc.def</code> for the Polish extension to the OT1 encoding, created by B. Jackowski and M. Ryćko for use with the Polish version of Computer Modern and Computer Concrete.
TU	generates <code>tuenc.def</code> for Unicode font encoding.
package	generates <code>fontenc.sty</code> for selecting encodings.
2ekernel	for the kernel commands.

20.4 Definitions for the kernel

20.4.1 Declaration commands

This section contains definitions for commands such as accents which depend on the current encoding. These commands will usually be kept in `.def` files, for example `ot1enc.def` contains the definitions for the OT1 encoding.

```
1 (*2ekernel)
2 \message{font encodings,}

Far too many macros in one block here!
```

```
\DeclareTextCommand If you say:
\ProvideTextCommand
\DeclareTextSymbol
\@dec@text@cmd then \foo is defined to be \T1-cmd \foo \T1\foo, where \T1\foo is one control
\chardef@text@cmd sequence, not two! We then call \newcommand to define \T1\foo.

13     }%
14   \let\@ifdefinable\@rc@ifdefinable
15   \expandafter#1\csname#3\string#2\endcsname}
```

This command was introduced to fix a major bug in `\@dec@text@cmd` without changing that command itself. This was thought to be necessary because it is defined in more than one package. (Perhaps the more serious bug is to put complex low-level commands like this in packages?)

The problem it solves is that whereas both `\newcommand` and `\providecommand` (used just above) both handle the resetting of `\@ifdefinable` (following its disabling in `\@dec@text@cmd`), the primitive `\chardef` neither needs the disabling, nor does the resetting.

```
16 \def\chardef@text@cmd{%
17   \let\@ifdefinable\@@ifdefinable
18   \chardef
19 }
20 \def\DeclareTextSymbol#1#2#3{%
21   \@dec@text@cmd\chardef@text@cmd#1{#2}#3\relax
22 }
```

The declarations are only available before `\begin{document}`.

```
23 \@onlypreamble\DeclareTextCommand
24 \@onlypreamble\DeclareTextSymbol
```

The sneaky bit in all this is what `\T1-cmd \foo \T1\foo` does. There are five possibilities, depending on the current values of `\protect`, `\cf@encoding` and `\ifmmode`:

- If `\protect` is `\@typeset@protect` and `\cf@encoding` is T1, then we execute `\T1\foo`. This should be the normal behaviour, and is optimized for speed.
- If `\protect` is `\@typeset@protect`, `\cf@encoding` is (say) OT1, and `\OT1\foo` is defined, then we execute `\OT1\foo`.
- If `\protect` is `\@typeset@protect`, `\cf@encoding` is (say) OT1, we're in text mode, and `\OT1\foo` is undefined, then we define `\OT1\foo` to be the default value of `\foo`, and execute `\OT1\foo`.
- If `\protect` is `\@typeset@protect`, `\cf@encoding` is (say) OT1, we're in math mode, and `\OT1\foo` is undefined, then we execute the default value of `\foo`. (This is necessary so that things like `X_\copyright` work properly.)
- If `\protect` is not `\@typeset@protect` then we execute `\noexpand\foo`. For example, if we are writing to a file, then this results in `\foo` being written. If we are in a `\mark`, then `\foo` will be put in the mark—since `\foo` is robust, it will then survive all the things which may happen to it whilst it's a `\mark`.

So after all that, we will either execute the appropriate definition of `\foo` for the current encoding, or we will execute `\noexpand\foo`.

The default value of `\foo` is `\?\foo` if it is defined, and an error message otherwise.

When the encoding is changed from T1 to OT1, `\T1-cmd` is defined to be `\@changed@cmd` and `\OT1-cmd` is defined to be `\@current@cmd`. This means that the test for what the current encoding is can be performed quickly.

```

25 \def\@current@cmd#1{%
26   \ifx\protect\@typeset@protect
27     \inmathwarn#1%
28   \else
29     \noexpand#1\expandafter\@gobble
30   \fi}

31 \def\@changed@cmd#1#2{%
32   \ifx\protect\@typeset@protect
33     \inmathwarn#1%
34     \expandafter\ifx\csname\cf@encoding\string#1\endcsname\relax
35       \expandafter\ifx\csname ?\string#1\endcsname\relax
36         \expandafter\def\csname ?\string#1\endcsname{%
37           \TextSymbolUnavailable#1%
38         }%
39       \fi
40       \global\expandafter\let
41         \csname\cf@encoding\string#1\expandafter\endcsname
42         \csname ?\string#1\endcsname
43     \fi
44     \csname\cf@encoding\string#1%
45       \expandafter\endcsname
46   \else
47     \noexpand#1%
48   \fi}

49 \gdef\TextSymbolUnavailable#1{%

```

```

50 \latex@error{%
51   Command \protect#1 unavailable in encoding \cf@encoding%
52 }\@eha}

```

The command `\@inmathwarn` produces a warning message if we are currently in math mode. Note that since this command is used inside text commands, it can't call `\relax` before the `\ifmmode`. This means that it is possible for the warning to fail to be issued at the beginning of a row of an `halign` whose template enters math mode. This is probably a bad feature, but there's not much that can be done about it, since adding a `\relax` would break ligatures and kerning between text symbols.

A more efficient solution would be to make `\@inmathwarn` and `\@inmatherr` equal to `\@empty` and `\relax` by default, and to have `\everymath` reset them to their usual definitions. This is left for future investigation (for example it may break some third party code).

```

53 \def\@inmathwarn#1{%
54   \ifmmode
55     \latex@warning{Command \protect#1 invalid in math mode}%
56   \fi}

```

`\DeclareTextCommandDefault` These define commands with encoding ?.

`\ProvideTextCommandDefault` Note that `\DeclareTextCommandDefault` can only be used in the preamble, but that the `\Provide` version is allowed in inputenc .def files, so is allowed anywhere.

```

57 \def\DeclareTextCommandDefault#1{%
58   \DeclareTextCommand#1?}

59 \def\ProvideTextCommandDefault#1{%
60   \ProvideTextCommand#1?}

61 \@onlypreamble\DeclareTextCommandDefault
62 %\@onlypreamble\ProvideTextCommandDefault

```

They require `\?<cmd>` to be initialized as `\@changed@cmd`.

```

63 \expandafter\let\csname?<cmd>\endcsname\@changed@cmd

```

`\DeclareTextAccent` This is just a disguise for defining a TeX `\accent` command.

```

64 \def\DeclareTextAccent#1#2#3{%
65   \DeclareTextCommand#1{#2}{\add@accent{#3}}
66 \@onlypreamble\DeclareTextAccent

```

`\add@accent` To save space this code is shared between all text accents that are set using the `\accent` primitive. The argument is pre-set in a box so that any font loading that is needed is already done within the box. This is needed because font-loading involves grouping and that would prevent the accent mechanism from working so that the accent would not be positioned over the argument. Declarations that change the font should be allowed (only low-level ones are at present) inside the argument of an accent command, but not size changes, as they involve `\setbox` operations which also inhibit the mechanism of the `\accent` primitive.

Note that the whole process is within a group. For a detailed discussion of this reimplementaion and its deficiencies, see pr/3160.

```

67 \def\add@accent#1#2{\hmode@bgroup

```

Turn off the group in `\UseTextSymbol` in case this is used inside the argument of `\add@accent`.

```
68 \let\hmode@start@before@group\@firstofone
69 \setbox\@tempboxa\hbox{#2%
```

When presetting the argument in a box we record its `\spacefactor` for later use after the accent got typeset. This way something like `\‘A` gets the spacefactor of A (i.e., 999) rather than the default value of 1000.

```
70 \global\mathchardef\accent@spacefactor\spacefactor}%
```

The accent primitive doesn't allow things `\begingroup` to interfere between accent and base character. Therefore we need to avoid that (they are some hidden inside `\maybe@load@fontshape`). As we don't have to load the fontshape in this case (as that happened in the box above if necessary, we simply disable that part of the code temporarily. We also ignore `\ignorespaces` which has the same issue and may show up as part of `\normalfont` if that is used.

```
71 \let\maybe@load@fontshape\relax
72 \let\ignorespaces\relax
73 \accent#1 #2\egroup\spacefactor\accent@spacefactor}
```

Default definition for `\accent@spacefactor` prevents a horrible death of the above macro inside an unprotected `\edef`.

```
74 \let\accent@spacefactor\relax
```

`\hmode@bgroup`

```
75 \def\hmode@bgroup{\leavevmode\bgroup}
```

`\DeclareTextCompositeCommand` Another amusing game to play with `\expandafter`, `\csname`, and `\string`. When you say `\DeclareTextCompositeCommand{\foo}{T1}{a}{bar}`, we look to see if the expansion of `\T1\foo` begins with `\@text@composite`, and if it doesn't, we redefine `\T1\foo` to be:

```
\@text@composite@x
\@strip@args
#1 -> \@text@composite \T1\foo #1\@empty \@text@composite {...}
```

where ... is the previous definition of `\T1\foo`. Finally, we define `\T1\foo-a` to expand to `bar`.

```

124 (*2ekernel)

125 \onlypreamble\DeclareTextCompositeCommand

```

This all works because:

```
\@text@composite \T1\foo A\@empty \@text@composite {...}
```

expands to `\T1\foo-A` if `\T1\foo-A` has been defined, and `{...}` otherwise.

Note that `\@text@composite` grabs the first token of the argument and puts just that in the csname. This is so that `\'{\textit{e}}` will work—it checks whether `\T1\'-\textit` is defined (which presumably it isn't) and so expands to `{\accent 1 \textit{e}}`.

This trick won't always work, for example `\'{{\itshape e}}` will expand to (with spaces added for clarity):

```
\csname \string \T1\' - \string {\itshape e} \@empty \endcsname
```

which will die pretty horribly. Unfortunately there's not much can be done about this if we're going to use `\csname` lookups as a fast way of accessing composites.

This has an unfortunate 'misfeature' though, which is that in the T1 encoding, `\'aa` produces á. This is not the expected behaviour, and should perhaps be fixed if the fix doesn't affect performance too badly.

Finally, it's worth noting that the `\@empty` is used in `\@text@composite` so that accents will work even when the argument is empty. If you say `\'{}` then

this looks up `\T1\'-\@empty`, which ought to be `\relax`, and so all is well. If we didn't include the `\@empty`, then `\'{}` would expand to:

```
\csname \string \T1\' - \string \endcsname
```

so the `\endcsname` would be `\string`'ed and the whole of the rest of the document would be put inside the `\csname`. This would not be good.

```
126 \def\@text@composite#1#2#3\@text@composite{%
127   \expandafter\@text@composite@x
128     \csname\string#1-\string#2\endcsname}
```

Originally the `\@text@composite@x` macro had two arguments and if `#1` was not `\relax` it was executed, otherwise `#2` was executed. All this happened within the `\ifx` code so that neither `#1` nor `#2` could have picked up any additional arguments from the input stream. This has now been changed using the typical `\@firstoftwo / \@secondoftwo` coding. This way the final expansion will happen without any `\else` or `\fi` intervening in the case that we need to get a further token from the input stream.

```
129 \def\@text@composite@x#1{%
130   \ifx#1\relax
131     \expandafter\@secondoftwo
132   \else
133     \expandafter\@firstoftwo
134   \fi
135   #1}
```

The command `\DeclareTextComposite` uses `\DeclareTextCompositeCommand` to declare a command which expands out to a single glyph.

```
136 \catcode\z@=11\relax

137 \def\DeclareTextComposite#1#2#3#4{%
138   \def\reserved@a{\DeclareTextCompositeCommand#1{#2}{#3}}%
139   \bgroup
140     \lccode\z@#4%
141     \lowercase{%
142   \egroup
143     \reserved@a ^^@}}

144 \catcode\z@=15\relax

145 \@onlypreamble\DeclareTextComposite

146 </2ekernel>

174 \ifkernel
175 \ifkernel\EndIncludeInRelease
176 \ifkernel

```

Switch to a different text encoding without any grouping for use in `\UseTextAccent` or `\UseTextSymbol` (and for `\oldstylenums`).

```

177 \def\@use@text@encoding#1{%
178 \edef\@f@encoding{#1}%
179 \xdef\@font@name{%
180 \csname\curr@fontshape/\@f@size\endcsname}%
181 \pickup@font
182 \font@name
183 \@@enc@update}

```

`\hmode@start@before@group` The `\hmode@start@before@group` starts hmode and should be immediately followed by an explicit `{...}`. Its purpose is to ensure that hmode is started before this group is opened. Inside `\add@accent` and `\UseTextAccent` it is redefined to remove this group so that it doesn't conflict with the `\accent` primitive.

For a detailed discussion see pr/3160.

```

184 \let\hmode@start@before@group\leavevmode

```

`\DeclareTextSymbolDefault` Some syntactic sugar. Again, these should probably be optimized for speed.

```

\DeclareTextAccentDefault
185 \def\DeclareTextSymbolDefault#1#2{%
186 \DeclareTextCommandDefault#1{\UseTextSymbol{#2}#1}}

187 \def\DeclareTextAccentDefault#1#2{%
188 \DeclareTextCommandDefault#1{\UseTextAccent{#2}#1}}

189 \onlypreamble\DeclareTextSymbolDefault
190 \onlypreamble\DeclareTextAccentDefault

```

`\UndeclareTextCommand` This command safely removes an encoding specific declaration for a given encoding. It is helpful if one intends to use the default definition always and therefore wants to get rid of a declaration for some specific encoding.

```
191 \def\UndeclareTextCommand#1#2{%
```

If there is no declaration for the current encoding do nothing. (This makes a hash table entry but without eTeX we can't do anything about that).

```
192   \expandafter\ifx\csname#2\string#1\endcsname\relax
193   \else
```

Else: throw away that declaration.

```
194     \global\expandafter\let\csname#2\string#1\endcsname
195     \@undefined
```

But this is unfortunately not enough, we have to take a look at the top-level definition of the encoding specific command which for a command `\foo` would look similar to `\T1-cmd \foo \T1\foo` (three tokens).

Of course, instead of `T1` one could see a different encoding name; which one depends the encoding for which `\foo` was declared last.

Now assume we have just removed the declaration for `\foo` in `T1` and the top-level of `\foo` expands to the above. Then we better change that pretty fast otherwise we do get an “undefined csname error” when we try to typeset `\foo` within `T1` instead of getting the default definition for `\foo`. And what is the best way to change that top-level definition? Well, the only “encoding” we know for sure will still be around is the default encoding denoted by `?`.

Thus in case the last token of the top-level expansion is now undefined we change the declaration to look like `\?-cmd \foo \?\foo` which is done by the following (readable?) code:

```
196   \expandafter\expandafter\expandafter
197   \ifx\expandafter\@thirdofthree#1\@undefined
198     \expandafter\gdef\expandafter#1\expandafter
199       {\csname ?-cmd\expandafter\endcsname\expandafter
200        #1\csname?\string#1\endcsname}%
201   \fi
202 \fi
203 }
204 \@onlypreamble\UndeclareTextCommand
```

20.4.2 Hyphenation

```

20.4.3 Miscellania

`\a` The `\a` command is used to access the accent commands even when they have been redefined (for example by the `tabbing` environment). Its internal name is `\@tabacckludge`.

The `\string` within the `\csname` guards against something like `'` being active at the point of use.

```

223 \def\@tabacckludge#1{\expandafter\@changed@cmd
224 \csname\string#1\endcsname\relax}
225 \let\a=\@tabacckludge

```

20.4.4 Default encodings

We define the default encodings for most commands to be either OT1, OML or OMS. These defaults are in the kernel and therefore fonts with these encodings must be available unless these defaults are redefined elsewhere. Recall that the standard kernel loads the encoding files for these encodings, and also that for the T1 encoding.

The naming conventions in the kernel are not what we would use if we were starting from scratch... Those defined by DEK (like `\ae` and `\ss`) or by the T_EX Users Group Technical Working Group on multi-lingual typesetting (like `\th` and `\ng`) have short names. Those which were added to the kernel in 1993 and early 1994 are named after their Adobe glyph names (like `\guillemotleft` and `\quotedblbase`). Unfortunately, this naming scheme won't work for all glyphs, since some names (like `\space`) are already used, and some (like `\endash`) are very likely to be defined by users. So we're now using the naming scheme of `\text` followed by the Adobe name, (like `\textendash` and `\textsterling`). Except that some glyphs don't have Adobe names, so we're using the names used by fontinst for those (like `\textcompwordmark`). Sigh.

Some accents from OT1:

```

226 \DeclareTextAccentDefault{"}{OT1}
227 \DeclareTextAccentDefault{'}{OT1}
228 \DeclareTextAccentDefault{.}{OT1}
229 \DeclareTextAccentDefault{=}{OT1}

```

```
274 \DeclareTextSymbolDefault{\textdaggerdbl}{OMS}
```

```
275 \DeclareTextSymbolDefault{\textdagger}{OMS}
```

```
276 \DeclareTextSymbolDefault{\textparagraph}{OMS}
```

```
277 \DeclareTextSymbolDefault{\textperiodcentered}{OMS}
```

```
278 \DeclareTextSymbolDefault{\textsection}{OMS}
```

```
279 \DeclareTextAccentDefault{\textcircled}{OMS}
```

Some symbols from OML:

```
280 \DeclareTextSymbolDefault{\textless}{OML}
```

```
281 \DeclareTextSymbolDefault{\textgreater}{OML}
```

```
282 \DeclareTextAccentDefault{\t}{OML}
```

Some defaults we can fake.

The interface for defining `\copyright` changed, it used to use `\expandafter` to add braces at the appropriate points.

```

283 \DeclareTextCommandDefault{\textcopyright}{\textcircled{c}}
284 % \expandafter\def\expandafter
285 % \copyright\expandafter{\expandafter{\copyright}}

286 \DeclareTextCommandDefault{\textasciicircum}{\textasciitilde}{\textcircled{c}}
287 \DeclareTextCommandDefault{\textasciitilde}{\textasciicircum}{\textcircled{c}}
288 \DeclareTextCommandDefault{\textunderscore}{\textasciitilde}{\textcircled{c}}
289 \leavevmode \kern.06em\vbox{\hrule\@width.3em}}

```

There is no good reason anymore to fake `\textcompwordmark`.

```

290 %\DeclareTextCommandDefault{\textcompwordmark}{\leavevmode\kern\z@}
291 \DeclareTextSymbolDefault{\textcompwordmark}{T1}

292 \DeclareTextCommandDefault{\textvisiblespace}{\textasciitilde}{\textcircled{c}}
293 \mbox{\kern.06em\vrule \@height.3ex}%
294 \vbox{\hrule \@width.3em}%
295 \hbox{\vrule \@height.3ex}}

```

Using `\fontdimen3` in the next definition is some sort of a kludge (since it is the interword stretch) but it makes the ellipsis come out right in mono-spaced fonts too (since there it is zero).

```

296 \DeclareTextCommandDefault{\textellipsis}{\textasciitilde}{\textcircled{c}}
297 .\kern\fontdimen3\font
298 .\kern\fontdimen3\font
299 .\kern\fontdimen3\font}

300 %\DeclareTextCommandDefault{\textregistered}{\textcircled{\scshape r}}
301 \DeclareTextCommandDefault{\textregistered}{\textcircled{\textasciitilde}{\textcircled{c}}}
302 \check@mathfonts\fontsize\sf@size\z@\math@fontsfalse\selectfont R}}
303 \DeclareTextCommandDefault{\texttrademark}{\textsuperscript{TM}}
304 \DeclareTextCommandDefault{\SS}{SS}

305 \DeclareTextCommandDefault{\textordfeminine}{\textsuperscript{a}}
306 \DeclareTextCommandDefault{\textordmasculine}{\textsuperscript{o}}

```

20.4.5 Math material

Some commands can be used in both text and math mode:

```

307 \DeclareRobustCommand{\$}{\ifmmode\mathdollar\else\textdollar\fi}

We use \protected not \DeclareRobustCommand so that \bigl\{ etc. works in-
side \protected@edef.

308 \protected\def\{{\ifmmode\lbrace\else\textbraceleft\fi}
309 \protected\def\}{\ifmmode\rbrace\else\textbraceright\fi}

310 \DeclareRobustCommand{\P}{\ifmmode\mathparagraph\else\textparagraph\fi}
311 \DeclareRobustCommand{\S}{\ifmmode\mathsection\else\textsection\fi}
312 \DeclareRobustCommand{\dag}{\ifmmode\dagger\else\textdagger\fi}
313 \DeclareRobustCommand{\ddag}{\ifmmode\ddagger\else\textdaggerdbl\fi}

```

For historical reasons `\copyright` needs `{}` around the definition in maths.

```

314 \DeclareRobustCommand{\_}{\textasciitilde}{\textcircled{c}}
315 \ifmmode\nfss@text{\textunderscore}\else\textunderscore\fi}
316 \DeclareRobustCommand{\copyright}{\textasciitilde}{\textcircled{c}}
317 \ifmmode{\nfss@text{\textcopyright}}\else\textcopyright\fi}
318 \DeclareRobustCommand{\pounds}{\textasciitilde}{\textcircled{c}}
319 \ifmmode\mathsterling\else\textsterling\fi}

```

```

320 \DeclareRobustCommand{\dots}{%
321   \ifmmode\mathellipsis\else\textellipsis\fi}
322 \let\ldots\dots

```

Default definition of the commabelow accent.

```

20.5 Definitions for the OT1 encoding

The definitions for the ‘T_EX text’ (OT1) encoding.

Declare the encoding.

```

376 \*OT1
377 \DeclareFontEncoding{OT1}{}{}

```

Declare the accents.

```

378 \DeclareTextAccent{"}{OT1}{127}
379 \DeclareTextAccent{'}{OT1}{19}
380 \DeclareTextAccent{\.}{OT1}{95}
381 \DeclareTextAccent{\=}{OT1}{22}
382 \DeclareTextAccent{\~}{OT1}{94}
383 \DeclareTextAccent{\'}{OT1}{18}
384 \DeclareTextAccent{\`}{OT1}{126}
385 \DeclareTextAccent{\H}{OT1}{125}
386 \DeclareTextAccent{\u}{OT1}{21}
387 \DeclareTextAccent{\v}{OT1}{20}
388 \DeclareTextAccent{\r}{OT1}{23}

```

Some accents have to be built by hand: Note that `\oalign` and `\o@lign` must be inside a group. In these definitions we no longer use the helper function `\sh@ft` from `plain.tex` since that now has two incompatible definitions.

```

389 \DeclareTextCommand{\b}{OT1}[1]
390   {\hmode\bgroup\o@lign{\relax#1\crrcr\hidewidth\ltx@sh@ft{-3ex}%
391     \vbox to.2ex{\hbox{\char22}\vss}\hidewidth}\egroup}
392 \DeclareTextCommand{\c}{OT1}[1]
393   {\leavevmode\setbox\z@\hbox{#1}\ifdim\ht\z@=1ex\accent24 #1%
394     \else{\oalign{\unhbox\z@\crrcr\hidewidth\char24\hidewidth}}\fi}
395 \DeclareTextCommand{\d}{OT1}[1]
396   {\hmode\bgroup
397     \o@lign{\relax#1\crrcr\hidewidth\ltx@sh@ft{-1ex}.\hidewidth}\egroup}

```

Declare the text symbols.

```

398 \DeclareTextSymbol{\AE}{OT1}{29}
399 \DeclareTextSymbol{\OE}{OT1}{30}
400 \DeclareTextSymbol{\O}{OT1}{31}
401 \DeclareTextSymbol{\ae}{OT1}{26}
402 \DeclareTextSymbol{\i}{OT1}{16}
403 \DeclareTextSymbol{\j}{OT1}{17}
404 \DeclareTextSymbol{\oe}{OT1}{27}
405 \DeclareTextSymbol{\o}{OT1}{28}
406 \DeclareTextSymbol{\ss}{OT1}{25}
407 \DeclareTextSymbol{\textendash}{OT1}{124}
408 \DeclareTextSymbol{\textendash}{OT1}{123}

```

Using the ligatures helps with OT1 fonts that have `\textexclamdown` and `\textquestiondown` in unusual positions.

```

409 %\DeclareTextSymbol{\textexclamdown}{OT1}{60}
410 %\DeclareTextSymbol{\textquestiondown}{OT1}{62}
411 \DeclareTextCommand{\textexclamdown}{OT1}{!'}
412 \DeclareTextCommand{\textquestiondown}{OT1}{?' }
413 %\DeclareTextSymbol{\texthyphenchar}{OT1}{'\-}
414 %\DeclareTextSymbol{\texthyphen}{OT1}{'\-}
415 \DeclareTextSymbol{\textquotedblleft}{OT1}{92}
416 \DeclareTextSymbol{\textquotedblright}{OT1}{'\'}
417 \DeclareTextSymbol{\textquoteleft}{OT1}{'\'}
418 \DeclareTextSymbol{\textquoteright}{OT1}{'\'}

```

Some symbols which are faked from others:

```

419 % \DeclareTextCommand{\aa}{OT1}
420 %   {\accent23a}
421 \DeclareTextCommand{\L}{OT1}
422   {\leavevmode\setbox\z@\hbox{L}\hb@xt@\wd\z@{\hss\@xxxii L}}
423 \DeclareTextCommand{\l}{OT1}
424   {\hmode\bgroup\@xxxii l\egroup}
425 % \DeclareTextCommand{\AA}{OT1}
426 %   {\leavevmode\setbox\z@\hbox{h}\dimen@ht\z@\advance\dimen@-1ex%
427 %     \rlap{\raise.67\dimen@\hbox{\char23}}A}

```

In the OT1 encoding Å has a hand-crafted definition, so we have here the first recorded explicit use of `\DeclareTextCompositeCommand`.

```

428 \DeclareTextCompositeCommand{\r}{OT1}{A}
429   {\leavevmode\setbox\z@\hbox{!}\dimen@ht\z@\advance\dimen@-1ex%
430     \rlap{\raise.67\dimen@\hbox{\char23}}A}

```

The dutch language uses the letter ‘ij’. It is available in T1 encoded fonts, but not in the OT1 encoded fonts. Therefor we fake it for the OT1 encoding.

```

431 \DeclareTextCommand{\ij}{OT1}{%
432   \nobreak\hskip\z@skip i\kern-0.02em j\nobreak\hskip\z@skip}
433 \DeclareTextCommand{\IJ}{OT1}{%
434   \nobreak\hskip\z@skip I\kern-0.02em J\nobreak\hskip\z@skip}

```

In the OT1 encoding, £ and \$ share a slot.

```

435 \DeclareTextCommand{\textdollar}{OT1}{\hmode\bgroup
436   \ifdim \fontdimen\@ne\font >\z@
437     \slshape
438   \else
439     \upshape
440   \fi
441   \char'\$ \egroup}

442 \DeclareTextCommand{\textsterling}{OT1}{\hmode\bgroup
443   \ifdim \fontdimen\@ne\font >\z@
444     \itshape
445   \else
446     \fontshape{ui}\selectfont
447   \fi
448   \char'\$ \egroup}

```

Here we are adding some more composite commands to the OT1 encoding. This makes the use of certain accents with i compatible with their use with the T1 encoding; this enables them to become true L^AT_EX internal representations.

However, it will make these accents work a little less fast since a check will always be made for the existence of a composite.

```

449 \DeclareTextComposite{\.}{OT1}{i}{'\i}
450 \DeclareTextComposite{\.}{OT1}{i}{'\i}
451 \DeclareTextCompositeCommand{\'}{OT1}{i}{\@tabacckludge'\i}
452 \DeclareTextCompositeCommand{\'}{OT1}{i}{\@tabacckludge'\i}
453 \DeclareTextCompositeCommand{\~}{OT1}{i}{\~\i}
454 \DeclareTextCompositeCommand{\~}{OT1}{i}{\~\i}

```

T1 encoding is given more extensive set of overloads for \c But here we just adjust \c{g}.

```

455 \ifx\textcommaabove\undefined\else
456 \DeclareTextCompositeCommand{\c}{OT1}{g}{\textcommaabove{g}}
457 \fi
458 \end{OT1}

```

20.6 Definitions for the T1 encoding

The definitions for the ‘Extended T_EX text’ (T1) encoding.

Declare the encoding.

```

459 \begin{OT1}
460 \DeclareFontEncoding{T1}{}{}

```

Declare the accents.

```

461 \DeclareTextAccent{\'}{T1}{0}
462 \DeclareTextAccent{\'}{T1}{1}
463 \DeclareTextAccent{\~}{T1}{2}
464 \DeclareTextAccent{\~}{T1}{3}
465 \DeclareTextAccent{\~}{T1}{4}
466 \DeclareTextAccent{\H}{T1}{5}
467 \DeclareTextAccent{\r}{T1}{6}
468 \DeclareTextAccent{\v}{T1}{7}
469 \DeclareTextAccent{\u}{T1}{8}
470 \DeclareTextAccent{\=}{T1}{9}
471 \DeclareTextAccent{\.}{T1}{10}

```

Some accents have to be built by hand. Note that \ooalign and \o@lign must be inside a group. In these definitions we no longer use the helper function \sh@ft from plain.tex since that now has two incompatible definitions.

```

472 \DeclareTextCommand{\b}{T1}[1]
473   {\hmode\bgroup\o@lign{\relax#1\crrc\hidewidth\ltx@sh@ft{-3ex}%
474     \vbox to.2ex{\hbox{\char9}\vss}\hidewidth}\egroup}
475 \DeclareTextCommand{\c}{T1}[1]
476   {\leavevmode\setbox\z@\hbox{#1}\ifdim\ht\z@=1ex\accent11 #1%
477     \else\ooalign{\unhbox\z@\crrc
478       \hidewidth\char11\hidewidth}}\fi}
479 \DeclareTextCommand{\d}{T1}[1]
480   {\hmode\bgroup
481     \o@lign{\relax#1\crrc\hidewidth\ltx@sh@ft{-1ex}.\hidewidth}\egroup}
482 \DeclareTextCommand{\k}{T1}[1]
483   {\hmode\bgroup\ooalign{\null#1\crrc\hidewidth\char12}\egroup}
484 \DeclareTextCommand{\textogonekcentered}{T1}[1]
485   {\hmode\bgroup\ooalign{%
486     \null#1\crrc\hidewidth\char12\hidewidth}\egroup}

```

Some symbols are constructed.

Slot 24 contains a small circle intended for construction of these two glyphs.

```
487 \DeclareTextCommand{\textperthousand}{T1}
488   {\%\char 24 }           % space or ‘relax as delimiter?
489 \DeclareTextCommand{\textpertenthousand}{T1}
490   {\%\char 24\char 24 }   % space or ‘relax as delimiter?
```

For Maltese, \Hwithstroke and \hwithstroke are needed.

```
491 \DeclareTextCommand{\Hwithstroke}{T1}
492   {%
493     \hmode\bgroup
494     \vphantom{H}%
495     \sbox\z@{H}%
496     \ooalign{%
497       H\cr
498       \hidewidth
499       \vrule
500       height \dimexpr 0.7\ht\z@+0.1ex\relax
501       depth  -0.7\ht\z@
502       width   0.8\wd\z@
503       \hidewidth\cr
504     }%
505     \egroup
506   }
507 \DeclareTextCommand{\hwithstroke}{T1}
508   {%
509     \hmode\bgroup
510     \vphantom{h}%
511     \sbox\z@{h}%
512     \ooalign{%
513       h\cr
514       \kern0.075\wd\z@
515       \vrule
516       height \dimexpr 0.7\ht\z@+0.1ex\relax
517       depth  -0.7\ht\z@
518       width   0.4\wd\z@
519       \hidewidth\cr
520     }%
521     \egroup
522   }
```

Declare the text symbols.

20.7 Definitions for the OMS encoding

The definitions for the ‘TeX math symbol’ (OMS) encoding. Even though this is meant to be a math font, it includes some of the standard L^AT_EX text symbols.

Declare the encoding.

```

709 (*OMS)
710 \DeclareFontEncoding{OMS}{-}{-}

```

Declare the symbols. Note that slot 13 has in places been named \Orb: please root out and destroy this impolity wherever you find it!

```

711 \DeclareTextSymbol{\textasteriskcentered}{OMS}{3} % "03
712 \DeclareTextSymbol{\textbackslash}{OMS}{110} % "6E
713 \DeclareTextSymbol{\textbar}{OMS}{106} % "6A
714 \DeclareTextSymbol{\textbardbl}{OMS}{107} % "6B
715 \DeclareTextSymbol{\textbraceleft}{OMS}{102} % "66
716 \DeclareTextSymbol{\textbraceright}{OMS}{103} % "67
717 \DeclareTextSymbol{\textbullet}{OMS}{15} % "0F
718 \DeclareTextSymbol{\textdaggerdbl}{OMS}{122} % "7A
719 \DeclareTextSymbol{\textdagger}{OMS}{121} % "79
720 \DeclareTextSymbol{\textparagraph}{OMS}{123} % "7B

726 \hfil \raise .07ex\hbox {\upshape#1}\hfil \crcr
727 \char 13 % "0D
728 }%
729 \egroup}
730 </OMS>

```

20.8 Definitions for the OML encoding

The definitions for the ‘ \TeX math italic’ (OML) encoding. Even though this is meant to be a math font, it includes some of the standard \LaTeX text symbols.

Declare the encoding.

```

731 <*OML>
732 \DeclareFontEncoding{OML}{-}{-}

```

Declare the symbols.

```

733 \DeclareTextSymbol{\textless}{OML}{'\<}
734 \DeclareTextSymbol{\textgreater}{OML}{'\>}
735 \DeclareTextAccent{\t}{OML}{127} % "7F
736 </OML>

```

20.9 Definitions for the OT4 encoding

These definitions are for the Polish extension to the ‘ \TeX text’ (OT1) encoding. This encoding was created by B. Jackowski and M. Ryćko for use with the Polish version of Computer Modern and Computer Concrete. In positions 0–127 it is identical to OT1 but it contains some additional characters in the upper half. The \LaTeX support was developed by Mariusz Olko.

The PL fonts that use it are available as follows:

Metafont sources <ftp://ftp.gust.org.pl/TeX/language/polish/pl-mf.zip>;

Font files <ftp://ftp.gust.org.pl/TeX/language/polish/pl-tfm.zip>.

Declare the encoding.

```

737 <*OT4>
738 \DeclareFontEncoding{OT4}{-}{-}
739 \DeclareFontSubstitution{OT4}{cmr}{m}{n}

```

Declare the accents.

```

740 \DeclareTextAccent{"}{OT4}{127}
741 \DeclareTextAccent{'}{OT4}{19}

```

```

742 \DeclareTextAccent{.}{OT4}{95}
743 \DeclareTextAccent{=}{OT4}{22}
744 \DeclareTextAccent{^}{OT4}{94}
745 \DeclareTextAccent{'}{OT4}{18}
746 \DeclareTextAccent{~}{OT4}{126}
747 \DeclareTextAccent{H}{OT4}{125}
748 \DeclareTextAccent{u}{OT4}{21}
749 \DeclareTextAccent{v}{OT4}{20}
750 \DeclareTextAccent{r}{OT4}{23}

```

The ogonek accent is available only under a e A & E. But we have to provide some definition for \k. Some other accents have to be built by hand as in OT1:

```

751 \DeclareTextCommand{\k}{OT4}[1]{%
752   \TextSymbolUnavailable{\k#1}#1}

```

In these definitions we no longer use the helper function \sh@ft from plain.tex since that now has two incompatible definitions.

```

753 \DeclareTextCommand{\b}{OT4}[1]
754   {\hmode\bgroup\o@lign{\relax#1\cr\hidewidth\ltx@sh@ft{-3ex}%
755     \vbox to.2ex{\hbox{\char22}\vss}\hidewidth}\egroup}
756 \DeclareTextCommand{\c}{OT4}[1]
757   {\leavevmode\setbox\z@\hbox{#1}\ifdim\ht\z@=1ex\accent24 #1%
758     \else{\o@lign{\unhbox\z@\cr\hidewidth\char24\hidewidth}}\fi}
759 \DeclareTextCommand{\d}{OT4}[1]
760   {\hmode\bgroup
761     \o@lign{\relax#1\cr\hidewidth\ltx@sh@ft{-1ex}.\hidewidth}\egroup}

```

Declare the text symbols.

```

762 \DeclareTextSymbol{\AE}{OT4}{29}
763 \DeclareTextSymbol{\OE}{OT4}{30}
764 \DeclareTextSymbol{\O}{OT4}{31}
765 \DeclareTextSymbol{\L}{OT4}{138}
766 \DeclareTextSymbol{\ae}{OT4}{26}

767 \DeclareTextSymbol{\guillemetleft}{OT4}{174}
768 \DeclareTextSymbol{\guillemetright}{OT4}{175}
769 % old Adobe names
770 \DeclareTextSymbol{\guillemotleft}{OT4}{174}
771 \DeclareTextSymbol{\guillemotright}{OT4}{175}

815 \DeclareTextComposite{\k}{OT4}{e}{166}
816 \DeclareTextComposite{\'}{OT4}{n}{171}
817 \DeclareTextComposite{\'}{OT4}{s}{177}
818 \DeclareTextComposite{\'}{OT4}{z}{185}
819 \DeclareTextComposite{\.}{OT4}{z}{187}
820 \DeclareTextComposite{\'}{OT4}{0}{211}
821 \DeclareTextComposite{\'}{OT4}{o}{243}
822 /OT4}

```

20.10 Definitions for the TS1 encoding

```
823 (*TS1)
824 \DeclareFontEncoding{TS1}{}{}
825 \DeclareFontSubstitution{TS1}{cmr}{m}{n}

```

Some accents have to be built by hand. Note that \oalign and \o@lign must be inside a group.

```
826 \DeclareTextCommand{\capitalcedilla}{TS1}[1]
827 {\hmode@bgroup
828 \oalign{\null#1\crrc\hidewidth\char11\hidewidth}\egroup}
829 \DeclareTextCommand{\capitalogonek}{TS1}[1]
830 {\hmode@bgroup

```

```
831 \oalign{\null#1\crrc\hidewidth\char12\hidewidth}\egroup}
```

Accents for capital letters.

These commands can be used by the end user either directly or through definitions of the type

```
\DeclareTextCompositeCommand{\'}{T1}{X}{\capitalacute X}
```

None of the latter definitions are provided by default, since they are probably rarely used.

"00 = 0

```
832 \DeclareTextAccent{\capitalgrave}{TS1}{0}
833 \DeclareTextAccent{\capitalacute}{TS1}{1}
834 \DeclareTextAccent{\capitalcircumflex}{TS1}{2}
835 \DeclareTextAccent{\capitaltilde}{TS1}{3}
836 \DeclareTextAccent{\capitaldieresis}{TS1}{4}
837 \DeclareTextAccent{\capitalhungarumlaut}{TS1}{5}
838 \DeclareTextAccent{\capitalring}{TS1}{6}
839 \DeclareTextAccent{\capitalcaron}{TS1}{7}
```

"08 = 8

```
840 \DeclareTextAccent{\capitalbreve}{TS1}{8}
841 \DeclareTextAccent{\capitalmacron}{TS1}{9}
842 \DeclareTextAccent{\capitaldotaccent}{TS1}{10}
```

Tie accents.

The tie accent was borrowed from the `cmmi` font. The `tc` fonts now provide four tie accents, the first two are done in the classical way with assymetric glyphs hanging out of their boxes; the new ties are centered in their boxes like all other accents. They need a name: please tell us if you know what to call them.

" =

```
843 \DeclareTextAccent{\t}{TS1}{26}
844 \DeclareTextAccent{\capitaltie}{TS1}{27}
845 \DeclareTextAccent{\newtie}{TS1}{28}
846 \DeclareTextAccent{\capitalnewtie}{TS1}{29}
```

Compound word marks.

The text companion fonts contain two compound word marks of different heights, one has `cap_height`, the other `asc_height`.

```
847 \DeclareTextSymbol{\textcapitalcompwordmark}{TS1}{23}
848 \DeclareTextSymbol{\textascendercompwordmark}{TS1}{31}
```

The text companion symbols.

```
849 \DeclareTextSymbol{\textquotestraightbase}{TS1}{13}
"10 = 16
850 \DeclareTextSymbol{\textquotestraightdblbase}{TS1}{18}
851 \DeclareTextSymbol{\texttwelveudash}{TS1}{21}
852 \DeclareTextSymbol{\textthrequartersemdash}{TS1}{22}
"18 = 24
853 \DeclareTextSymbol{\textleftarrow}{TS1}{24}
854 \DeclareTextSymbol{\textrightarrow}{TS1}{25}
```

20.11 Definitions for the TU encoding

The TU encoding was originally introduced in the contributed package `fontspec` as a Unicode encoding for XeTeX and LuaTeX.

Normally for these engines, the input consists of Unicode characters encoded in UTF-8. There is therefore little need to use the traditional (ASCII) encoding-specific commands

However, sometimes (e.g. for backwards compatibility) it can be useful to access these Unicode characters via such ASCII-based markup. The commands provided here cover the characters in the T1 and TS1 encodings, but specified in Unicode position. Almost all the command names have been mechanically extracted from the `inputenc` UTF-8 support, which is essentially doing a reverse mapping from UTF-8 data to L^AT_EX LICR commands.

A few additional names for character which were supported in the original `fontspec` version of this file have also been added, even though they are not currently in the default `inputenc` UTF-8 declarations.

963 `{*TU}`

In the base interface the Unicode encoding is always known as TU. But we parameterise the encoding name to allow for modelling differences in Unicode support by different fonts.

964 `\providecommand\UnicodeEncodingName{TU}`

As the Unicode encoding, TU, is only currently available with XeTeX or LuaTeX, we detect these engines first, and make adjustments for the differing font loading syntax. For other engines, we issue a warning then abort this file, switching back to T1 encoding.

965 `\begingroup\expandafter\expandafter\expandafter\endgroup`

966 `\expandafter\ifx\csname XeTeXrevision\endcsname\relax`

967 `\begingroup\expandafter\expandafter\expandafter\endgroup`

968 `\expandafter\ifx\csname directlua\endcsname\relax`

Not LuaTeX or XeTeX, abort with a warning.

969 `\PackageWarningNoLine{fontenc}`

970 `{\UnicodeEncodingName\space`

971 `encoding is only available with XeTeX and LuaTeX.\MessageBreak`

972 `Defaulting to T1 encoding}`

973 `\def\encodingdefault{T1}`

974 `\expandafter\expandafter\expandafter\endinput`

975 `\else`

LuaTeX.

21 Package files

This file now also contains some packages that provide access to the more specialised encodings.

21.1 The fontenc package

This package allows authors to specify which encodings they will use. For each encoding F00, the package looks to see if the encoding F00 has already been declared. If it has not, the file `fooenc.def` is loaded. The default encoding is set to be F00.

In addition the package at the moment contains extra code to extend the `\@uclclist` (list of upper/lower case pairs) for encodings that involve cyrillic characters. THIS IS A TEMPORARY SOLUTION and will not stay this way forever (or so we hope) but right now we are missing a proper interface for this and didn't wanted to rush it.

1440 (*package)

Here we define a macro that extends the `\@uclclist` if needed and afterwards turns itself in a noop.

```
1441 \def\update@uclc@with@cyrillic{%
1442   \expandafter\def\expandafter\@uclclist\expandafter
1443   {\@uclclist
1444    \cyr\CYRA\cyrahch\CYRABHCH\cyrahchdsc\CYRABHCHDSC\cyrahhdze

1465    \cyru\CYRU\cyrushrt\CYRUSHRT\cyrv\CYRV\cyrw\CYRW\cyry\CYRY
1466    \CYRYO\cyryu\CYRYU\cyrz\CYRZ\cyzdsdsc\CYRZDSC\cyzrh\CYRZH
1467    \cyzhdsc\CYRZHDSC}%
1468   \let\update@uclc@with@cyrillic\relax
1469 }
1470 }
```

Here we process each option:

```
1471 \DeclareOption*{%
1472   \let\encodingdefault\CurrentOption

```

From 2020/02/02 release onward we only load the encoding files if they haven't be loaded already. To check this we look if `\T@encoding` is already defined. If not we load (indicated by setting the switch `@tempwa` to true and we always load if we run in an older format (or rather in a rollback situation).

```

1473 \@tempswafalse
1474 \@ifl@t@r\fmtversion{2020/02/02}%
1475     {\expandafter\ifx\csname T@\CurrentOption\endcsname\relax
1476       \@tempswattrue\fi}%
1477     {\@tempswattrue}%

Load if necessary:
1478 \if@tempswa
1479     \edef\reserved@f{%
1480       \lowercase{\def\noexpand\reserved@f{\CurrentOption enc.def}}}%
1481     \reserved@f
1482     \InputIfFileExists\reserved@f
1483     {}{\PackageError{fontenc}%
1484       {Encoding file ‘\reserved@f’ not found.%
1485        \MessageBreak
1486        You might have misspelt the name of the encoding}%
1487     {Necessary code for this encoding was not
1488      loaded.\MessageBreak
1489      Thus calling the encoding later on will
1490      produce further error messages.}}%
1491     \let\reserved@f\relax

In case the current encoding is one of a list of known cyrillic ones we extend
the \@uclclist:
1492     \expandafter\in@\expandafter{\CurrentOption}%
1493                                     {T2A,T2B,T2C,X2,LCY,OT2}%
1494     \ifin@

But only if it hasn't already been extended. This might happen if there are
several calls to fontenc loading one of the above encodings. If we don't do this check
the \@uclclist gets unnecessarily big, slowing down the processing at runtime.
1495     \expandafter\in@\expandafter\cyr@\expandafter
1496                                     {\@uclclist}%
1497     \ifin@
1498     \else
1499         \update@uclc@with@cyrillic
1500     \fi
1501 \fi
1502 \fi
1503 }

1504 \ProcessOptions*

We select the new font encoding default (i.e., the last encoding specified in the
option list. But this encoding may not work with the current \f@shape, e.g., LY1
is not defined for cmr and therefore packages switching to LY1 usually also change
\rmdefault. But that only applies at \begin{document} so we get a spurious
warning if we use what LATEX previously used:
1505 %\fontencoding\encodingdefault\selectfont

So instead we do this here:
1506 \usefont\encodingdefault\familydefault\seriesdefault\shapedefault

To save some space we get rid of the macro extending the \@uclclist (might
have happened already).
1507 \let\update@uclc@with@cyrillic\relax

```

Finally we pretend that the fontenc package wasn't read in. This allows for using it several times, e.g., in a class file and in the preamble (at the cost of not getting any version info). That kind of hackery shows that using a general purpose package just for loading an encoding is not the right kind of interface for setting up encodings — it will get replaced at some point in the future.

```

1508 \let\@elt\relax
1509 \xdef\@fontenc@load@list{\@fontenc@load@list
1510   \@elt{\csname opt@fontenc.sty\endcsname}}

1511 \global\expandafter\let\csname ver@fontenc.sty\endcsname\relax
1512 \global\expandafter\let\csname opt@fontenc.sty\endcsname\relax
1513 \global\let\@ifl@ter@@\@ifl@ter
1514 \def\@ifl@ter#1#2#3#4#5{\global\let\@ifl@ter\@ifl@ter@@}
1515 \endpackage

```

File m

ltcounts.dtx

22 Counters and Lengths

Commands for defining and using counters. This file defines:

<code>\newcounter</code>	To define a new counter.
<code>\setcounter</code>	To set the value of counters.
<code>\addtocounter</code>	Increase the counter #1 by the number #2.
<code>\stepcounter</code>	Increase a counter by one.
<code>\refstepcounter</code>	Increase a counter by one, also setting the value used by <code>\label</code> .
<code>\value</code>	For accessing the value of the counter as a T _E X number (as opposed to <code>\the<counter></code> which expands to the <i>printed</i> representation of <code><counter></code>)
<code>\arabic</code>	<code>\arabic{<counter>}</code> : 1, 2, 3, ...
<code>\roman</code>	<code>\roman{<counter>}</code> : i, ii, iii, ...
<code>\Roman</code>	<code>\Roman{<counter>}</code> : I, II, III, ...
<code>\alph</code>	<code>\alph{<counter>}</code> : a, b, c, ...
<code>\Alph</code>	<code>\Alph{<counter>}</code> : A, B, C, ...
<code>\fnsymbol</code>	<code>\fnsymbol{<counter>}</code> : *, †, ‡, ...
<code>\counterwithin</code>	<code>\counterwithin{<counter>}{<within-counter>}</code> : Resets <code><counter></code> whenever <code><within-counter></code> is stepped. Also redefines <code>\the<counter></code> command to produce <code>\the<within-counter>.\arabic{<counter>}</code> . Star form omits redefining the print representation.
<code>\counterwithout</code>	<code>\counterwithout{<counter>}{<within-counter>}</code> : Removes <code><counter></code> from the reset list of <code><within-counter></code> . Also redefines <code>\the<counter></code> command to produce <code>\arabic{<counter>}</code> . Star form omits redefining the print representation.

1 (*2ekernel)

22.1 Environment Counter Macros

An environment foo has an associated counter defined by the following control sequences:

<code>\c@foo</code>	Contains the counter's numerical value. It is defined by <code>\newcount\foocounter</code> .
<code>\thefoo</code>	Macro that expands to the printed value of <code>\foocounter</code> . For example, if sections are numbered within chapters, and section headings look like Section II-3. The Nature of Counters then <code>\thesection</code> might be defined by: <code>\def\thesection</code> <code>{\@Roman{\c@chapter}-\@arabic{\c@section}}</code>
<code>\p@foo</code>	Macro that expands to a printed 'reference prefix' of counter foo. Any <code>\ref</code> to a value created by counter foo will produce the expansion of <code>\p@foo\thefoo</code> when the <code>\label</code> command is executed. See file <code>ltxref.dtx</code> for an extension of this mechanism.
<code>\cl@foo</code>	List of counters to be reset when foo stepped. Has format <code>\@elt{countera}\@elt{counterb}\@elt{counterc}</code> .

NOTE:

`\thefoo` and `\p@foo` *must* be defined in such a way that `\edef\bar{\thefoo}` or `\edef\bar{\p@foo}` defines `\bar` so that it will evaluate to the counter value at the time of the `\edef`, even after `\foocounter` and any other counters have been changed. This will happen if you use the standard commands `\@arabic`, `\@Roman`, etc.

The following commands are used to define and modify counters.

`\refstepcounter{<foo>}`

Same as `\stepcounter`, but it also defines `\@currentreference` so that a subsequent `\label{<bar>}` command causes `\ref{<bar>}` to generate the current value of counter `<foo>`.

`\@definecounter{<foo>}`

Initializes counter `{<foo>}` (with empty reset list), defines `\p@foo` and `\thefoo` to be null. Also adds `<foo>` to `\cl@ckpt` – the reset list of a dummy counter `@ckpt` used for taking checkpoints for the `\include` system.

`\@addtoreset{<foo>}{<bar>}` : Adds counter `<foo>` to the list of counters `\cl@bar` to be reset when counter `<bar>` is stepped.

`\@removefromreset{<foo>}{<bar>}` : Removes counter `<foo>` to the list of counters `\cl@bar` to be reset when counter `<bar>` is stepped.

`\setcounter` `\setcounter{<foo>}{<val>}` : Globally sets `\foocounter` equal to `<val>`.

```
2 \def\setcounter#1#2{%
3   \@ifundefined{c@#1}%
4     {\@nocounterr{#1}}%
5     {\global\csname c@#1\endcsname#2\relax}}
```

`\addtocounter` `\addtocounter{<foo>}{<val>}` Globally increments `\foocounter` by `<val>`.

```
6 \def\addtocounter#1#2{%
7   \@ifundefined{c@#1}%
8     {\@nocounterr{#1}}%
9     {\global\advance\csname c@#1\endcsname #2\relax}}
```

`\newcounter` `\newcounter{<newctr>}[<oldctr>]` Defines `<newctr>` to be a counter, which is reset when counter `<oldctr>` is stepped. If `<newctr>` already defined produces ‘`c@newctr` already defined’ error.

```
10 \def\newcounter#1{%
11   \expandafter\@ifdefinable \csname c@#1\endcsname
12     {\@definecounter{#1}}%
13   \@ifnextchar[{\@newctr{#1}}{-}]}
```

`\value` `\value{<ctr>}` produces the value of counter `<ctr>`, for use with a `\setcounter` or `\addtocounter` command.

```
14 \def\value#1{\csname c@#1\endcsname}
```

`\@newctr`

```
15 \def\@newctr#1[#2]{%
16   \@ifundefined{c@#2}{\@nocounterr{#2}}{\@addtoreset{#1}{#2}}}
```

`\stepcounter` `\stepcounterfoo` Globally increments counter `\c@F00` and resets all subsidiary counters.

```
17 \def\stepcounter#1{%
```

```

18 \addtocounter{#1}\@ne
19 \begingroup
20 \let\@elt\@stpelt
21 \csname cl@#1\endcsname
22 \endgroup}

```

\@stpelt Rather than resetting the “within” counter to zero we set it to -1 and then run **\stepcounter** that moves it to 0 and also initiates resetting the next level down.

```

125   Y\or Z\else\@ctrerr\fi}
```

`\@fnsymbol` Typesetting old fashioned footnote symbols. This can be done both in text or math mode now.

This macro is another example of an ever recurring problem in \TeX : Determining if something is text-mode or math-mode. It is imperative for the decision between text and math to be delayed until the actual typesetting is done as the code in question may go through an `\edef` or `\write` where an `\ifmode` test would be executed prematurely. Hence in the implementation below, `\@fnsymbol` is not robust in itself but the parts doing the actual typesetting are.

In the case of `\@fnsymbol` we make use of the robust command `\TextOrMath` which takes two arguments and typesets the first if in text-mode and the second if in math-mode. Note that in order for this command to make the correct decision, it must insert a `\relax` token if run under regular \TeX , which ruins any kerning between the preceding characters and whatever awaits typesetting. If you use $\epsilon\TeX$ as engine for \LaTeX (as recommended) this unfortunate side effect is not present.

```
126 \</2ekernel>
127 \<latexrelease>\IncludeInRelease{2015/01/01}{\@fnsymbol}{Use \TextOrMath}%
128 \<*2ekernel | latexrelease>
129 \def\@fnsymbol#1{%

144 \<latexrelease>\def\@fnsymbol#1{\ensuremath{%
145 \<latexrelease>   \ifcase#1\or *\or \dagger\or \ddagger\or \mathsection\or
146 \<latexrelease>   \mathparagraph\or ||\or **\or \dagger\dagger
147 \<latexrelease>   \or \ddagger\ddagger \else\@ctrerr\fi}}%
148 \<latexrelease>\EndIncludeInRelease
149 \<*2ekernel>
```

`\TextOrMath` When using regular \TeX , we make this command robust so that it always selects the correct branch in an `\ifmode` switch with the usual disadvantage of ruining kerning. For the application we use it for here that shouldn't matter. The alternative would be to mimic `\IeC` from `inputenc` but then it will have the disadvantage of choosing the wrong branch if appearing at the beginning of an alignment cell.

However, users of eTeX will be pleasantly surprised to get the best of both worlds and no bad side effects.

First some code for checking if we are running eTeX but making sure not to permanently turn `\protected` into `\relax`.

```
150 </2ekernel>
151 <latexrelease>\IncludeInRelease{2015/01/01}{\TextOrMath}{\TextOrMath}%
152 <*2ekernel | latexrelease>
153 \begingroup\expandafter\expandafter\expandafter\endgroup
154 \expandafter\ifx\csname protected\endcsname\relax
```

In case of ordinary TeX we define `\TextOrMath` as a robust command but make sure it always grabs its arguments. If we didn't do this it might very well gobble spaces in the input stream.

```
155 \DeclareRobustCommand\TextOrMath{%
156   \ifmmode   \expandafter\@secondoftwo
157   \else      \expandafter\@firstoftwo   \fi}
158 \protected@edef\TextOrMath#1#2{\TextOrMath{#1}{#2}}
159 \else
```

For eTeX the situation is similar. The robust macro is a hidden one so that we again avoid problems of gobbling spaces in the input.

```
160 \protected\expandafter\def\csname TextOrMath\space\endcsname{%
161   \ifmmode   \expandafter\@secondoftwo
162   \else      \expandafter\@firstoftwo   \fi}
163 \edef\TextOrMath#1#2{%
164   \expandafter\noexpand\csname TextOrMath\space\endcsname
165   {#1}{#2}}
166 \fi

\@settopoint This macro takes the contents of the skip register that is supplied as its argument
and removes the fractional part to make it a whole number of points. This can be
used in class files to avoid values like 345.4666666pt when calculating a dimension.

22 \def\@settopoint#1{\divide#1\p@\multiply#1\p@}
23 (/2ekernel)

```

File o

ltfssbas.dtx

This file contains the main implementation of the ‘low level’ font selection commands. See other parts of the L^AT_EX distribution, or *The L^AT_EX Companion* for higher level documentation of the L^AT_EX ‘New’ Font Selection Scheme.

Warning: The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

24 Preliminary macros

We define a number of macros that will be used later.

`\@nomath` `\@nomath` is used by most macros that will have no effect in math mode. It issues a warning message.

```
1 (*2kernel)
2 \def\@nomath#1{\relax\ifmmode
3   \@font@warning{Command \noexpand#1invalid in math mode}\fi}
```

`\no@alphabet@error` The macro `\no@alphabet@error` is called whenever the user requests a math *alphabet* that is not available in the current *version*. In math mode an error message is produced otherwise the command keeps silent. The argument is the name of the control sequence that identifies the math *alphabet*. The `\relax` at the beginning is necessary to prevent T_EX from scanning too far in certain situations.

```
4 \gdef\no@alphabet@error#1{\relax \ifmmode
5   \@latex@error{Math\space alphabet\space identifier\space
6     \noexpand#1is\space undefined\space in\space math\space
7     version\space ‘\math@version’}%
8   {Your\space requested\space math\space alphabet\space
9     is\space undefined\space in\space the\space current\space
10    math\space version.^^JCheck\space the\space spelling\space
11    or\space use\space the\space \noexpand\SetMathAlphabet\space
12    command.}
13   \fi}
```

`\new@mathgroup` We also give a new name to `\newfam` and `\fam` to avoid verbal confusion (see the introduction).²

`\mathgroup`

```
14 %\def\new@mathgroup{\alloc@8\mathgroup\chardef\sixt@@n}
15 \let\mathgroup\fam
16 %\let\newfam\new@mathgroup
17 \@onlypreamble\new@mathgroup
```

²For the same reason it seems advisable to `\let\fam` and `\newfam` equal to `\relax`, but this is commented out to retain compatibility to existing style files.

25 Macros for setting up the tables

`\DeclareFontShape` The macro `\DeclareFontShape` takes 6 arguments:

```
18 \def\DeclareFontShape{\begingroup
```

First we restore the catcodes of all characters used in the syntax.

```
19 \nfss@catcodes
```

We use `\expandafter \endgroup` to restore catcode in case something goes wrong with the argument parsing (suggested by Tim Van Zandt)

`\DeclareFontShape`

```
20 \expandafter\endgroup
21 \DeclareFontShape@}
22 \def\DeclareFontShape#1#2#3#4#5#6{%
23 \expandafter\ifx\csname #1+#2\endcsname\relax
24 \@latex@error{Font family ‘#1+#2’ unknown}\@eha
25 \else
26 \expandafter
27 \xdef\csname#1/#2/#3/#4\endcsname{\expandafter\noexpand
28 \csname #5\endcsname}%
29 \def\reserved@a{#6}%
30 \global
31 \expandafter\let\csname#5\endcsname\expandafter\endcsname
32 \ifx\reserved@a@empty
33 \@empty
34 \else
35 \reserved@a
36 \fi
37 \fi
38 }
```

`\DeclareFixedFont` Define a direct font switch that avoids all overhead.

```
39 \def\DeclareFixedFont#1#2#3#4#5#6{%
40 \begingroup
41 \math@fontsfalse
42 \every@math@size{}%
43 \fontsize{#6}\z@
44 \usefont{#2}{#3}{#4}{#5}%
45 \global\expandafter\let\expandafter#1\the\font
46 \endgroup
47 }
```

`\do@subst@correction`

```
48 \def\do@subst@correction{%
49 \xdef\subst@correction{%
50 \font@name
51 \global\expandafter\font
52 \csname \curr@fontshape/\f@size\endcsname
53 \noexpand\fontname\font
54 \relax}%

```

Calling `\subst@correction` after the current group means calling it after we have loaded the substitution font which is done inside a group.

```
55 \aftergroup\subst@correction
56 }
```

`\DeclareFontFamily`

```
57 \def\DeclareFontFamily#1#2#3{%
```

If we want fast checking for the encoding scheme we can just check for `\T@. .` being defined.

```
58 % \@tempswafalse
59 % \def\reserved@b{#1}%
60 % \def\cdp@elt##1##2##3##4{\def\reserved@c{##1}%
61 %     \ifx\reserved@b\reserved@c \@tempswatrue\fi}%
62 % \cdp@list
63 % \if@tempswa
64 % \ifundefined{T@#1}%
65 %     {%
66 %         \@latex@error{Encoding scheme ‘#1’ unknown}\@eha
67 %     }%
68 % }
```

Now we have to define the macro `\<#1>+<#2>` to contain `#3`. But since most of the time `#3` will be empty we use `\let` in a tricky way rather than a simple `\def` since this will save internal memory. We store the argument `#3` in a temporary macro `\reserved@a`.

```
69     \def\reserved@a{#3}%
```

We compare `\reserved@a` with `\@empty`. If these two are the same we `\let` the ‘extra’ macro equal to `\@empty` which is not the same as doing a `\let` to `\reserved@a` — the latter would blow one extra memory location rather than reusing the one from `\@empty`.

```
70     \global
71     \expandafter\let\csname #1+#2\expandafter\endcsname
72         \ifx \reserved@a\@empty
73             \@empty
74         \else \reserved@a
75         \fi
76     }%
77 }
```

`\cdp@list` We initialize the code page list to be empty.

```
78 \let\cdp@list\@empty
79 \@onlypreamble\cdp@list
```

`\cdp@elt`

```
80 \let\cdp@elt\relax
81 \@onlypreamble\cdp@elt
```

`\DeclareFontEncoding`

```
82 \def\DeclareFontEncoding{%
```

First we start with ignoring all blanks and newlines since every surplus space in the second or third argument will come out in a weird place in the document.

```
83     \begingroup
84     \nfss@catcodes
85     \expandafter\endgroup
86     \DeclareFontEncoding@}
87 \@onlypreamble\DeclareFontEncoding
```

```

88 \def\DeclareFontEncoding#1#2#3{%
89   \expandafter
90   \ifx\csname T@#1\endcsname\relax
91     \def\cdp@elt{\noexpand\cdp@elt}%
92     \xdef\cdp@list{\cdp@list\cdp@elt{#1}%
93                   {\default@family}{\default@series}%
94                   {\default@shape}}%

```

To support encoding dependent commands (like accents) we initialise the command `\<encoding>-cmd` to be `\@changed@cmd`. (See `ltoutenc.dtx` for details.)

```

95   \expandafter\let\csname#1-cmd\endcsname\@changed@cmd
96   \else
97     \font@info{Redeclaring font encoding #1}%
98   \fi
99   \global\@namedef{T@#1}{#2}%
100  \global\@namedef{M@#1}{\default@M#3}%

```

Keep a record of the last encoding being declared:

```

101  \xdef\LastDeclaredEncoding{#1}%
102  }
103 \@onlypreamble\DeclareFontEncoding@

```

`\LastDeclaredEncoding` The last encoding being declared by `\DeclareFontEncoding`.

```

104 \def\LastDeclaredEncoding{}

```

`\DeclareFontSubstitution`

```

105 \def\DeclareFontSubstitution#1#2#3#4{%
106   \expandafter
107   \ifx\csname T@#1\endcsname\relax
108     \@latex@error{Encoding scheme ‘#1’ unknown}\@eha
109   \else
110     \begingroup

```

We loop through the `\cdp@list` and rebuild it anew in `\toks@` thereby replacing the defaults for the encoding in question with the new defaults. It is important to store the encoding to test against expanded in `\reserved@a` since it might just be `\LastDeclaredEncoding` that is passed as `#1`.

```

111     \edef\reserved@a{#1}%
112     \toks@{}%
113     \def\cdp@elt##1##2##3##4{%
114       \def\reserved@b{##1}%
115       \ifx\reserved@a\reserved@b

```

Here we use the new defaults but we use `##1` (i.e., the encoding name already stored previously) since we know that it is expanded.

```

116       \addto@hook\toks@{\cdp@elt{##1}{##2}{##3}{##4}}%

```

Don't know at the moment what this group here does!

```

153   \begin{group}

```

We define a macro `\reserved@f`³ that grabs the next *size* and loads the corresponding font. This is done by delimiting `\reserved@f`'s only argument by the token `,` (comma).

```

154   \def\reserved@f##1,{%

```

The end of the list will be detected when there are no more elements, i.e. when `\reserved@f`'s argument is empty. The trick used here is explained in Appendix D of the *T_EXbook*: if the argument is empty the `\if` will select the first clause and `\let \reserved@f equal to \relax`. (We use the `>` character here since it cannot appear in font file names.)

```

155   \if>##1>%

```

³We cannot use `\@tempa` since it is needed in `\pickup@font`.

```

156         \let\reserved@f\relax
157     \else

```

Otherwise, we define `\font@name` appropriately and call `\pickup@font` to do the work. Note that the requested `\curr@fontshape` combination must have been defined, or you will get an error. The definition of `\font@name` is carried out globally to be consistent with the rest of the code in this file.

```

158         \xdef\font@name{\csname#1/#2/#3/#4/##1\endcsname}%
159         \pickup@font

```

Now we forget the name of the font just loaded. More precisely, we set the corresponding control sequence to `\relax`. This means that later on, when the font is first used, the macro `\define@newfont` is called again to execute the ‘extra’ macro for this font.

```

160         \global\expandafter\let\font@name\relax
161     \fi

```

Finally we call `\reserved@f` again to process the next *size*. If `\reserved@f` was `\let` equal to `\relax` this will end the macro.

```

162     \reserved@f}%

```

We finish with reinserting the list of sizes after the `\reserved@f` macro and appending an empty element so that the end of the list is recognized properly.

26 Selecting a new font

26.1 Macros for the user

`\fontencoding` As we said in the introduction a font is described by four parameters. We first define macros to specify the wanted *family*, *series*, or *shape*. These are simply recorded in internal macros `\f@family`, `\f@series`, and `\f@shape`, resp. We use `\edef`'s so that the arguments can also be macros.

```

215 \DeclareRobustCommand\fontencoding[1]{%
216 \expandafter\ifx\csname T@#1\endcsname\relax
217 \<\latex@error{Encoding scheme ‘#1’ unknown}\@eha
218 \else
219 \edef\f@encoding{#1}%
220 \ifx\cf@encoding\f@encoding

```

If the new encoding is the same as the old encoding we have nothing to do. However, in case we had a sequence of several encoding changes without a `\selectfont` in-between we can save processing by making sure that `\enc@update` is `\relax`.

```

221      \let\enc@update\relax
222      \else

```

If current and new encoding differ we define the macro `\enc@update` to contain all updates necessary at `\selectfont` time.

```

223      \let\enc@update\@@enc@update
224      \fi
225      \fi
226 }

```

`\@@enc@update`

```

227 \def\@@enc@update{%

```

When `\@@enc@update` is executed `\f@encoding` holds the encoding name for the new encoding and `\cf@encoding` the name of the last active encoding.

We start by setting the init command for encoding dependent macros to `\@changed@cmd`.

```

228      \expandafter
229      \let
230      \csname\cf@encoding -cmd\endcsname
231      \@changed@cmd

```

Then we turn the one for the new encoding to `\@current@cmd` (see `ltoutenc.dtx` for further explanations).

```

232      \expandafter
233      \let
234      \csname\f@encoding-cmd\endcsname
235      \@current@cmd

```

We execute the default settings `\default@T`, followed by the one for the new encoding.

```

236      \default@T
237      \csname T@\f@encoding\endcsname

```

Finally we change the default substitution values, disable `\enc@update` and make `\f@encoding` officially the current encoding.

```

238      \csname D@\f@encoding\endcsname
239      \let\enc@update\relax
240      \let\cf@encoding\f@encoding
241 }

```

`\enc@update` The default action in `\selectfont` is to do nothing.

```

242 \let\enc@update\relax

```

`\fontfamily`

```

\fontfamily 243 \DeclareRobustCommand\fontfamily[1]{\edef\f@family{#1}}

```

`\fontseries` There are now defined later (and differently).

```

\fontseries 244 %\DeclareRobustCommand\fontseries[1]{\edef\f@series{#1}}

```

```

\fontshape 245 %\DeclareRobustCommand\fontshape [1]{\edef\f@shape{#1}}

```

`\f@shape`

`\usefont` Some handy abbreviation if you want to get some particular font in the current size. If also the size should change one has to issue a `\fontsize` command first.

`\fontencoding` needs to do some setup work so we call that, but instead of calling `\fontfamily`, `\fontseries` and `\fontshape` it earlier versions of this

code did, we now set `\f@family`, etc. directly. If we would call `\fontseries` or `\fontshape` as it was done in the past, they would now interact with the existing series and shape which is not desired if we intend to use an explicit font shape!

```
246 \DeclareRobustCommand\usefont[4]{\fontencoding{#1}%
247   \edef\f@family{#2}%
248   \edef\f@series{#3}%
249   \edef\f@shape{#4}\selectfont
250   \ignorespaces}
```

`\linespread` The command `\linespread` changes the current `\baselinestretch` by calling `\set@fontsize`. The values for `\f@size` and `\f@baselineskip` will be left unchanged.

```
251 \DeclareRobustCommand\linespread[1]
252   {\set@fontsize{#1}\f@size\f@baselineskip}
```

`\fontsize` We also define a macro that allows to specify a size. In this case, however, we also need the value of `\baselineskip`. As the first argument to `\set@fontsize` we pass the current value of `\baselinestretch`. This will either match the internal value (in which case nothing changes, or it will be an updated value due to a user change of that macro using `\renewcommand`. If we would pass the internal `\f@linespread` such a change would be effectively overwritten by a size change.

```
253 \DeclareRobustCommand\fontsize[2]
254   {\set@fontsize\baselinestretch{#1}{#2}}
```

`\f@linespread` This macro holds the current internal value for `\baselinestretch`.

```
255 \let\f@family\@empty
256 \let\f@series\@empty
257 \let\f@shape\@empty
258 \let\f@size\@empty
259 \let\f@baselineskip\@empty
260 \let\f@linespread\@empty
```

`\cf@encoding`

```
261 \let\f@encoding\@empty
262 \let\cf@encoding\@empty
```

`\@defaultunits` The function `\@defaultunits` when wrapped around a dimen or skip assignment supplies default units. Usage:

```
\@defaultunits\dimen@=#1pt\relax\@nnil
```

Note: the `\relax` is **important**. Other units can be substituted for the ‘pt’ if desired.

We use `\remove@to@nnil` as an auxiliary macros for `\@defaultunits`. It just has to gobble the supplied default unit ‘pt’ or whatever, if it wasn’t used in the assignment.

```
263 \def\@defaultunits{\afterassignment\remove@to@nnil}
```

`\strip@pt` This macro strips the characters `pt` produced by using `\the` on a dimen register.

```
\rem@pt
264 \begingroup
265   \catcode‘P=12
266   \catcode‘T=12
267   \lowercase{
```

```

268 \def\x{\def\rem@pt##1.##2PT{##1\ifnum##2>\z@.##2\fi}}
269 \expandafter\endgroup\x
270 \def\strip@pt{\expandafter\rem@pt\the}

```

`\mathversion` `\mathversion` takes the math *version* name as argument, defines `\math@version` appropriately and switches to the font selected forcing a call to `\glb@settings` if the *version* is known to the system.

```

271 \DeclareRobustCommand\mathversion[1]
272     {\@nomath\mathversion
273     \expandafter\ifx\csname mv@#1\endcsname\relax
274     \@latex@error{Math version ‘#1’ is not defined}\@eha\else
275     \edef\math@version{#1}%

```

We need to force a math font setup both now and at the point where we return to the previous math version. Forcing a math font setup can simply be done by setting `\glb@currsz` to an invalid value since this will trigger the setup when the formula starts.

```

276 \gdef\glb@currsz{}%

```

When the scope of the current `\mathversion` ends we need to restore the old setup. However this time we need to force it directly at least if we are inside math, otherwise we could wait. Another way to enhance this code here is to do the setting only if the version really has changed after all. This might be interesting in case of `amstext` and `boldsymbol`.

```

277 \aftergroup\glb@settings
278 \fi}

```

If $\mathrm{T}_{\mathrm{E}}\mathrm{X}$ would support a hook just before the end of a formula (opposite of `\everymath` so to speak) the implementation of the algorithm would be much simpler because in that case we would set up the correct math fonts at this point without having to worry about incorrect settings due to nesting. The same would be true if in $\mathrm{L}^{\mathrm{A}}\mathrm{T}_{\mathrm{E}}\mathrm{X}$ the use of $\$$ (as the primitive $\mathrm{T}_{\mathrm{E}}\mathrm{X}$ command) would be impossible and instead only a higher-level interface would be available. Note that this does not mean that a $\$$ couldn't be the short-hand for starting and stopping that higher-level interface, it only means that the direct $\mathrm{T}_{\mathrm{E}}\mathrm{X}$ function must be hidden.

Anyway, since we don't have this and won't have it in $\mathrm{L}^{\mathrm{A}}\mathrm{T}_{\mathrm{E}}\mathrm{X} 2_{\epsilon}$ we need to implement it in a somewhat slower way.

We test for the current math font setup on entry of a formula, i.e., on the hooks `\everymath` and `\everydisplay`. But since these hooks may contain user data we provide ourselves with an internal version of these hooks which stays frozen.

```

\frozen@everymath New internal names for \everymath and \everydisplay.
\frozen@everydisplay 279 \let\frozen@everymath\everymath
280 \let\frozen@everydisplay\everydisplay

```

```

\everymath Now we provide now user hooks that will be called in the frozen internals.
\everydisplay 281 \newtoks\everymath
282 \newtoks\everydisplay

```

```

\frozen@everymath Now we define the behaviour of the frozen hooks: first check the math setup then
call the user hook.
283 \frozen@everymath = {\check@mathfonts
284 \the\everymath}

```

`\frozen@everydisplay` Ditto for the display hook.

```

285 \frozen@everydisplay = {\check@mathfonts
286                          \the\everydisplay}
```

`\curr@math@size` This holds locally the current math size.

```

287 \let\curr@math@size\@empty
```

26.2 Macros for loading fonts

`\pickup@font` The macro `\pickup@font` which is used in `\selectfont` is very simple: if the font name is undefined (i.e. not known yet) it calls `\define@newfont` to load it.

```

288 \def\pickup@font{%
289   \expandafter \ifx \font@name \relax
290     \define@newfont
291   \fi}
```

`\split@name` `\pickup@font` assumes that `\font@name` is set but it is sometimes called when `\f@family`, `\f@series`, `\f@shape`, or `\f@size` may have the wrong settings (see, e.g., the definition of `\getanddefine@fonts`). Therefore we need a macro to extract font *family*, *series*, *shape*, and *size* from the font name. To this end we define `\split@name` which takes the font name as a list of characters of `\catcode` 12 (without the backslash at the beginning) delimited by the special control sequence `\@nil`. This is not very complicated: we first ensure that `/` has the right `\catcode`

```

292 {\catcode'\/=12
```

and define `\split@name` so that it will define our private `\f@encoding`, `\f@family`, `\f@series`, `\f@shape`, and `\f@size` macros.

```

293 \gdef\split@name#1/#2/#3/#4/#5\@nil{\def\f@encoding{#1}%
294                                     \def\f@family{#2}%
295                                     \def\f@series{#3}%
296                                     \def\f@shape{#4}%
297                                     \def\f@size{#5}}}
```

`\curr@fontshape` Abbreviation which may get removed again for speed.

```

298 \def\curr@fontshape{\f@encoding/\f@family/\f@series/\f@shape}
```

`\define@newfont` Now we can tackle the problem of defining a new font.

```

299 \def\define@newfont{%
```

We have already mentioned that the token list that `\split@name` will get as argument must not start with a backslash. To reach this goal we will set the `\escapechar` to `-1` so that the `\string` primitive will not generate an escape character. To keep this change local we open a group. We use `\begingroup` for this purpose since `\define@newfont` might be called in math mode, and an empty `\bgroup... \egroup` would add an empty Ord atom to the math list and thus affect the spacing.

Also locally redefine `\typeout` so that ‘No file ...fd’ Warnings become Font Info message just sent to the log file.

```

300 \begingroup
301   \let\typeout\@font@info
302   \escapechar\m@ne
```

Then we extract *encoding scheme*, *family*, *series*, *shape*, and *size* from the font name. Note the four `\expandafter`'s so that `\font@name` is expanded first, then `\string`, and finally `\split@name`.

```
303 \expandafter\expandafter\expandafter
304 \split@name\expandafter\string\font@name\@nil
```

If the `\curr@fontshape` combination is not available, (i.e. undefined) we call the macro `\wrong@fontshape` to take care of this case. Otherwise `\extract@font` will load the external font for us.

```
305 % \expandafter\ifx
306 % \csname\curr@fontshape\endcsname \relax
307 \try@load@fontshape % try always
308 % \fi
309 \expandafter\ifx
310 \csname\curr@fontshape\endcsname \relax
311 \wrong@fontshape\else
```

To allow substitution we call the `\curr@fontshape` macro which usually will expand to `\relax` but may hold code for substitution (see `\subst@fontshape` definition).

```
312 % \csname\curr@fontshape\endcsname
313 \extract@font\fi
```

We are nearly finished and must only restore the `\escapechar` by closing the group.

```
314 \endgroup}
```

```
315 \def\try@load@fontshape{%
316 \expandafter
317 \ifx\csname \f@encoding+\f@family\endcsname\relax
318 \font@info{Trying to load font information for
319 \f@encoding+\f@family}%
```

We predefine this combination to be `\@empty` which means that next time we don't try again unnecessary in case we don't find a `.fd` file. If the file contains a `\DeclareFontFamily` command than this setting will be overwritten.

```
320 \global\expandafter\let
321 \csname\f@encoding+\f@family\endcsname\@empty
```

Set the catcodes used in the syntax, but do it only once (this will be restored at the end of the font loading group).

```
322 \nfss@catcodes
323 \let\nfss@catcodes\relax
```

For increased portability make the external filename monospace, but look for the (old style) mixed case filename if the first attempt fails.

On any monospace system this means that the file is looked for twice which takes up time and string space, but at least for this release Check for both names to give people time to re-install their private fd files with lowercase names.

```
324 \edef\reserved@a{%
325 \lowercase{%
326 \noexpand\inputIfFileExists{\f@encoding\f@family.fd}}}%
327 \reserved@a\relax
328 {\@input@\f@encoding\f@family.fd}%
329 \fi}
```

`\nfss@catcodes` This macro should contain the standard `\catcode` assignments to all characters which are used in the commands found in an `.fd` file and which might have special `\catcodes` in the middle of a document. If necessary, this list can be extended in a package file using a suitable number of `\expandafter`, i.e.,

```
\expandafter\def\expandafter\nfss@catcodes
\expandafter{\nfss@catcodes <additional settings>}
```

Note, that this macro might get executed several times since it is also called by `\DeclareFontShape`, thus it probably should not be misused as a general purpose hook.

```
330 \def\nfss@catcodes{%
```

We start by making `@` a letter and ignoring all blanks and newlines.

```
331 \makeatletter
332 \catcode'\ 9%
333 \catcode'\^^I9%
334 \catcode'\^^M9%
```

Then we set up `\`, `{`, `}`, `#` and `%` in case an `.fd` file is loaded during a verbatim environment.

```
335 \catcode'\z@
336 \catcode'\{ \@ne
337 \catcode'\}\ @tw@
338 \catcode'\#6%
339 \catcode'\^7%
340 \catcode'\%14%
```

Then we make sure that the important syntax parts have the right `\catcode`.

```
341 \@makeother\<%
342 \@makeother\>%
343 \@makeother\*%
344 \@makeother\.%
345 \@makeother\-%
346 \@makeother\/%
347 \@makeother\[%
348 \@makeother\]%
349 \@makeother\'%
350 \@makeother\'%
351 \@makeother\"%
352 }
```

`\LoadFontDefinitionFile` Load and `.fd` files for some encoding and family (if it exists).

```
353 </2ekernel>

370 \latexrelease\EndIncludeInRelease
371 \*2ekernel)

```

DeclareFontFamilySubstitution The idea for this macro is stolen from the `substitutefont` package by Günter Milde, with some modifications and a new name.

Its purpose is to provide characters in a special encoding tht are not available in the current font family to be taken from a different family that is visually compatible (or not if you choose badly). For example, you can match the GFS Didot Greek characters with T_EX Gyre Pagella (Palatino) by specifying

```
\DeclareFontFamilySubstitution{LGR}{qpl}{udidot}
```

This way if you ask for the LGR encoding in for the qpl family you get the characters from the udidot family substituted.

We need to ensure that the macro is defined with `\nfss@catcodes` in force (not quite sure why at the moment to be honest).

```

447 \@onlypreamble\DeclareErrorFont

```

`\wrong@fontshape` Before we come to the macro `\extract@font` we have to take care of unknown `\curr@fontshape` combinations. The general strategy is to issue a warning and to try a default *shape*, then a default *series*, and finally a default *family*. If this last one also fails T_EX will go into an infinite loop. But if the defaults are set incorrectly one deserves nothing else!

```

448 \endkernel)
449 \latexrelease)\IncludeInRelease{2015/01/01}{\wrong@fontshape}%
450 \latexrelease) {Font substitution in preamble}%
451 (*2ekernel | \latexrelease)
452 \def\wrong@fontshape{%
453   \csname D@f@encoding\endcsname % install defaults if in math
454   \edef\reserved@a{\csname\curr@fontshape\endcsname}%
455   \ifx\last@fontshape\reserved@a
456     \errmessage{Corrupted NFSS tables}%
457     \error@fontshape
458   \else

```

Then we warn the user about the mess and set the shape to its default.

```

459   \let\f@shape\default@shape

```

If the combination is not known, try the default *series*.

```

460   \expandafter\ifx\csname\curr@fontshape\endcsname\relax
461     \let\f@series\default@series

```

If this is still undefined, try the default *family*. Otherwise give up. We never try to change the encoding scheme!

```

462   \expandafter
463   \ifx\csname\curr@fontshape\endcsname\relax
464     \let\f@family\default@family

```

If we change the font family and we are in the preamble then the corresponding `.fd` file may not been loaded yet. Therefore we try this now. Otherwise equating the requested font shape with the finally selected fontshape below will fail and can result in “NFSS tables corrupted”. After begin document that will not happen as all `.fd` files involved in substitution are loaded at `\begin{document}`.

```

465     \begingroup
466     \try@load@fontshape
467   \endgroup
468   \fi \fi
469 \fi

```

At this point a valid `\curr@fontshape` combination must have been found. We inform the user about this fact.

The `\expandafter\string` here stops TeX adding the space that it usually puts after command names in messages. The similar construction with `\undefined` just produces ‘undefined’, but saves a few tokens.

`\@wrong@font@char` is locally redefined in `\UseTextSymbol` from its normal (empty) definition, to report the symbol generating the font switch.

```
470 \font@warning{Font shape ‘\expandafter\string\reserved@a’
471 \expandafter\@gobble\string\undefined\MessageBreak
472 using ‘\curr@fontshape’ instead\@wrong@font@char}%
473 \global\let\last@fontshape\reserved@a
```

We change `\@defaultsubs` to produce a warning at the end of the document.

The macro `\@defaultsubs` is initially `\relax` but gets changed here if some default font substitution happens. It is then executed in `\enddocument`.

```
474 \gdef\@defaultsubs{%
475 \font@warning{Some font shapes were not available, defaults
476 substituted.\@gobbletwo}}%
```

If we substitute a `\curr@fontshape` combination by the default one we don’t want the warning to be printed out whenever this (unknown) combination is used. Therefore we globally `\let` the macro corresponding to the wanted combination equal to its substitution. This requires the use of four `\expandafter`’s since `\csname...\endcsname` has to be expanded before `\reserved@a` (i.e. the requested combination), and this must happen before the `\let` is executed.

```
477 \global\expandafter\expandafter\expandafter\let
478 \expandafter\reserved@a
479 \csname\curr@fontshape\endcsname
```

Now we can redefine `\font@name` accordingly. This *must* be done globally since it might occur in the group opened by `\define@newfont`. If we would this definition were local the closing `\endgroup` there would restore the old meaning of `\font@name` and then switch to the wrong font at the end of `\selectfont` although the correct font was loaded.

```
480 \xdef\font@name{%
481 \csname\curr@fontshape/\f@size\endcsname}%
```

The last thing this macro does is to call `\pickup@font` again to load the font if it is not defined yet. At this point this code will loop endlessly if the defaults are not well defined.

```
482 \pickup@font}

```

`\@wrong@font@char` Normally empty but redefined in `\UseTextSymbol` so that the Font shape undefined message can refer to the symbol causing the problem.

```
519 \let\@wrong@font@char\@empty
```

`\@defaultsubs` See above.

```
\@defaultsubs 520 \let\@defaultsubs\relax
```

`\strip@prefix` In `\extract@font` we will need a way to recover the replacement text of a macro. This is done by the primitive `\meaning` together with the macro `\strip@prefix` (for the details see appendix D of the *T_EXbook*, p. 382).

```
521 \def\strip@prefix#1>{\}
```

27 Assigning math fonts to *versions*

`\install@mathalphabet` This is just another name for `\gdef` but we can redefine it if necessary later on.

```
522 \let\install@mathalphabet\gdef
```

`\math@fonts`

```
523 \let\math@fonts\@empty
```

`\select@group` `\select@group` has four arguments: the new *math alphabet identifier* (a control sequence), the *math group number*, the extra macro for math mode and the `\curr@fontshape` definition macro name. We first check if we are in math mode.

```
524 %\def\select@group#1#2#3{\relax\ifmmode
```

We do these things locally using `\begingroup` instead of `\bgroup` to avoid the appearance of an empty Ord atom on the math list.

```
525 % \begingroup
```

We set the math fonts for the *family* in question by calling `\getanddefine@fonts` in the correct environment.

```
526 %      \escapechar\m@ne
527 %      \getanddefine@fonts{\csname c@mv@math@version\endcsname}#3%
```

We globally select the math fonts...

```
528 %      \globaldefs\@ne \math@fonts
```

... and close the group to restore `\globaldefs` and `\escapechar`.

```
529 % \endgroup
```

As long as no *size* or *version* change occurs the $\langle\textit{math alphabet identifier}\rangle$ should simply switch to the installed *math group* instead of calling `\select@group` unnecessarily. So we globally redefine the first argument (the new $\langle\textit{math alphabet identifier}\rangle$) to expand into a `\mathgroup` switch and then select this *alphabet*. Note that this redefinition will be overwritten by the next call to a *version* macro.

The original code for the end of `\select@group` was

```
\gdef#1{#3\mathgroup #2}#1\fi}
```

i.e. first redefining the $\langle\textit{math alphabet identifier}\rangle$ and then calling the new definition to switch to the wanted $\langle\textit{math group}\rangle$. Now we define the $\langle\textit{math alphabet identifier}\rangle$ as a call to the `\use@mathgroup` command.

```
530 % \xdef#1{\noexpand\use@mathgroup\noexpand#2%
531 %      {\number\csname c@mv@math@version\endcsname}}%
```

But this is not sufficient, as we learned the hard way. The problem here is that the loading of the fonts that comprise the alphabet identifier `#1`, as well as the necessary math font assignments is deferred until it is used. This is OK so far, but if the fonts are switched within the current formula (which may happen if a sub-formula is a box that contains a math version switch) the font assignments for `#1` are not restored unless `#1` is used again. This is disastrous since TeX sees the wrong fonts at the end of the math formula, when it converts the math list into a horizontal list.

This is taken into account as follows: When a math alphabet identifier is used for the first time in a certain version it modifies the corresponding macro `\mv@version` so that it calls `\getanddefine@fonts` directly in future as well. We use the macro `\extract@alph@from@version` to do this. It takes the math alphabet identifier `#1` and the math version macro as arguments.

```
532 %      \expandafter\extract@alph@from@version
533 %      \csname mv@math@version\expandafter\endcsname
534 %      \expandafter{\number\csname c@mv@math@version\endcsname}%
535 %      #1%
536 %      \stepcounter{mv@math@version}%
```

Finally, it is not possible to simply call the new definition since we have an argument (the third argument of `\use@mathgroup` or more exactly the argument of `\math@egroup` if the `margid` option is in force) which would swallow our closing `\fi`. So we use the `\expandafter` technique to remove the `\fi` before the `\use@mathgroup` is expanded.

```
537 %\expandafter #1\fi}
```

`\extract@alph@from@version` We proceed to the definition of the macro `\extract@alph@from@version`. As stated above, it takes a math alphabet identifier and a math version macro (e.g. `\mv@normal`) as its arguments.

538 `\def\extract@alph@from@version#1#2#3{%`

To extract and replace the definition of math alphabet identifier #3 in macro #1 we have to recall how this definition looks like: Somewhere in the replacement text of #1 there is the sequence

`\install@mathalphabet<math alphabet identifier> #3{%`
`<Definitions for >#3}`

Hence, the first thing we do is to extract the tokens preceding this definitions, the definition itself, and the tokens following it. To this end we define one auxiliary macro `\reserved@a`.

539 `\def\reserved@a##1\install@mathalphabet#3##2##3\@nil{%`

When `\reserved@a` is expanded, it will have the tokens preceding the definition in question in its first argument (`##1`), the following tokens in its third argument (`##3`), and the replacement text for the math alphabet identifier #3 in its second argument. (`##2`). This is then recorded for later use in a temporary macro `\reserved@b`.

540 `\def\reserved@b{##2}%`

Additionally, we define a macro `\reserved@c` to reconstruct the definitions for the math version in question from the tokens that will remain unchanged (`##1` and `##3`) and the yet to build new definitions for the math alphabet identifier #3.

541 `\def\reserved@c####1{\gdef#1{##1####1##3}}%`

Then we execute our auxiliary macro.

542 `\expandafter\reserved@a#1\@nil`

OK, so now we have to build the new definition for #3. To do so, we first extract the interesting parts out of the old one. The old definition looks like:

`\select@group<math alphabet identifier>`
`<math group number><math extra part>`
`<curr@fontshape definition>`

So we define a new temporary macro `\reserved@a` that extracts these parts.

543 `\def\reserved@a\select@group#3##1##2\@nil{%`

This macro can now directly rebuild the math version definition by calling `\reserved@c`:

544 `\reserved@c{%`
545 `\getanddefine@fonts{#2}##2%`
546 `\install@mathalphabet#3{%`
547 `\relax\ifmmode \else \non@alpherr#3\fi`
548 `\use@mathgroup##1{#2}}%`

In addition it defines the alphabet the way it should be used from now on.

549 `\gdef#3{\relax\ifmmode \else \non@alpherr#3\fi`
550 `\use@mathgroup##1{#2}}%`

Finally, we only have to call this macro `\reserved@a` on the old definitions recorded in `\reserved@b`:

551 `\expandafter\reserved@a\reserved@b\@nil`
552 `}`

`\math@bgroup` Here are the default definitions for `\math@bgroup` and `\math@egroup`. We use
`\math@egroup` `\bgroup` instead of `\begingroup` to avoid ‘leaking out’ of style changes. This has the side effect of always producing mathord atoms.

```

553 \let\math@bgroup\bgroup
554 \def\math@egroup#1{#1\egroup}

```

`\calculate@math@sizes` Here is the default definition for `\calculate@math@sizes` a more elaborate interface is under testing in `mathscale.sty`.

```

555 \gdef\calculate@math@sizes{%
556   \@font@info{Calculating\space math\space sizes\space for\space
557     size\space <\f@size>}%
558   \dimen@ \f@size \p@
559   \@tempdimb \defaultscriptratio \dimen@
560   \dimen@ \defaultscriptscriptratio \dimen@
561   \expandafter\xdef\csname S@\f@size\endcsname{%
562     \gdef\noexpand\tf@size{\f@size}%
563     \gdef\noexpand\s@size{\strip@pt\@tempdimb}%
564     \gdef\noexpand\ssf@size{\strip@pt\dimen@}%
565     \noexpand\math@fontstrue}}

```

`\defaultscriptratio` The default ratio for math sizes is:
`\defaultscriptscriptratio` 1 to `\defaultscriptratio` to `\defaultscriptscriptratio`.
 By default this is 1 to .7 to .5.

```

566 \def\defaultscriptratio{.7}
567 \def\defaultscriptscriptratio{.5}

```

`\noaccents@` If we don't have a definition for `\noaccents@` we provide a dummy.

```

568 \ifx\noaccents@\@undefined
569   \let\noaccents@\@empty
570 \fi

```

`\showhyphens` The `\showhyphens` command must be redefined since the version in `plain.tex` uses `\tenrm`. We have also made some further adjustments for its use in L^AT_EX.

```

Xe_TE_X version. When using system fonts Xe_TE_X reports consecutive runs of characters as a single item in box logging, which means the standard `\showhyphens` does not work. This version typesets the text into a narrow box to force hyphenation and then reconstructs a horizontal list with explicit hyphens to generate the display. Note that the `lmr` OpenType font is forced, this works even if the characters are not in the font as hyphenation is attempted due to the width of the space

and hyphen character. It may generate spurious Missing Character warnings in the log, these are however suppressed from the terminal output by ensuring that `\tracingonline` is locally zero.

```

File p

ltfssaxes.dtx

This file contains the implementation for handling extra axes splitting the series and the values into sub-categories. selection commands. See other parts of the L^AT_EX distribution, or *The L^AT_EX Companion* for higher level documentation of the L^AT_EX Font Selection Scheme.

Everything in the this file got introduced 2020/02/02, so we do a single rollback (for now).

```

28 Changing the font series

In the original NFSS implementation the series was a single attribute stored in `\f@series` and so one always had to specify both weight and width together. This means it was impossible to typeset, a paragraph in a condensed font and inside have a few words in bold weight (but still condensed) without doing this manually by requesting `\fontseries{bc}\selectfont`.

The new implementation now works differently by looking both at the current value of `\f@series` and the requested new series and out of that combination selects a resulting series value. Thus, if the current series is `c` and we ask for `b` we now get `bc`.

This is done by consulting a simple lookup table. This table is configurable (though most likely that flexibility will seldom of ever be needed) Adding or changing entries in this table are done with `\DeclareFontSeriesChangeRule`.

28.1 The series lookup table

`\DeclareFontSeriesChangeRule` The `\DeclareFontSeriesChangeRule` defines entries in a simple database (implemented as a set of commands) that define mappings between from an existing series and requested new series and maps that to a result series (and additionally offers an alternative if the desired one is not existing):

```
#1 current \f@series
#2 requested new series
#3 result (if that exist for the given font family
#4 alternative result (if #3 does not exist)
```

If an `.fd` file has its own substitution rules then `#3` exist and thus `#4` is not applied.

If there is no matching database entry or if neither the result nor the alternate result exist in the font family the requested new series is used (which then may trigger substitutions later on).

```
6 \def\DeclareFontSeriesChangeRule#1#2#3#4{%
7   \@namedef{series@#1@#2}{#{#3}#{#4}}}
```

28.2 Mapping rules for series changes

The rules set up use explicit series values not `\..default` indirections; my current feeling is that this is in fact better.

With 9 weights and 9 width classes this table is getting a bit large in the end (324 entries) but on the other hand it doesn't change and accessing speed and it is fast this way.

We could alternatively split the axis and maintain weight and width separately, but that would take more processing time and would not allow for setting up explicit exceptions nicely (not sure that this would ever get used though).

Design considerations for mapping entries:

- We make `m` to reset both weight and width (as this is how it always worked). To reset just the width `?m` is provided and to reset just the weight `m?`.
- We do support “*mwidth*” and “*weightm*”, e.g., `mec` to mean “go to medium weight and extra-condensed width”. At the end of the process we automatically drop any leftover `m` in the series name (unless it is just a single `m`).
- If there is no table entry then the target series is used unconditionally. This means that any request to set both weight and width (e.g. `bx` or `ulc`) needs no table entries. For that reason there are no entries which have a weight+width as request (i.e., second argument).

In particular this is also true for cases involving `m`, e.g., `bm` (bold medium width) which automatically gets reduced result in `b` or `mc` (medium weight condensed) which becomes `c` as a result.

- Only a few entries have “alterative” values and perhaps most of them should get dropped. Or maybe not ... needs some thought perhaps.

The idea is that you don't want the normal substitution to kick in because that would reset the shape first and it may be better to stay with `b` when a change to `c` is requested and `bc` doesn't exist, than to go to first change the shape to `n` and then find that `bc/n` doesn't exist either and thus ending up with `m/n`.

- Also: while I did set up all nine standard weight values from `ul` to `ub` I only bothered to provide entries for `ec`, `sc`, `c` and `x`, because other levels of compression/expansion are not in any real fonts that I know.

Could and perhaps should be eventually extended to cover the whole set.

Special rules for `lm` etc. aren't needed because if the target `lm` is request it will be used if there is no rule and that id then reduced to `l` automatically. Same for `mc` and friends. Only `?m` and `m?` need rules.

So here are the special rules for `m?`:

```

286 \DeclareFontSeriesChangeRule {bc}{m?}{c}{-}
287 \DeclareFontSeriesChangeRule {bec}{m?}{ec}{-}
288 \DeclareFontSeriesChangeRule {bsc}{m?}{sc}{-}

```

28.3 Changing to a new series

`\fontseriesforce` To change unconditionally to a new series you can use `\fontseriesforce`. If course, if the series doesn't exist for the current family substitution still happens, but there is not dependency on the current series.

```

385 \DeclareRobustCommand\fontseriesforce[1]{\edef\f@series{#1}}

```

`\fontseries` The `\fontseries` command takes one argument which is the requested new font series. In the original implementation it simply saved the expanded value in `\f@series`. Now we do a bit more processing and look up the final value in the font series data base. This is done by `\merge@font@series`.

```

386 \DeclareRobustCommand\fontseries[1]{\merge@font@series{#1}}

```

`\merge@font@series` We look up the data base value by expanding the right command twice. If no such value exist then the result will be `\relax` otherwise it will be the two brace groups: the desired result and the alternate result. The first case means that the third argument to `\merge@font@series` will be empty.

```

387 \def\merge@font@series#1{%
388   \expandafter\expandafter\expandafter
389   \merge@font@series@
390   \csname series@\f@series @#1\endcsname
391   {#1}%
392   \@nil
393 }

```

`\merge@font@series@` This now defines the new `\f@series`:

```

394 \def\merge@font@series@#1#2#3\@nil{%

```

If the third argument is empty there is no database entry for the combination and the second argument holds the new series so we return that.

Originally the test was simply `\ifx!#3!` but that actually dies if `#3` starts with a conditional and in the definition of `\AmSfont` that is actually the case.

```

395 %\ifcat\expandafter X\detokenize{#1}X%
396 \def\reserved@a{#3}%
397 \ifx\reserved@a\@empty
398   \set@target@series{#2}%
399 \else

```

Otherwise we check if the desired result for the series (`#1`) exists for the font family and the current shape. As the `.fd` is perhaps not loaded yet, we first have to do that, otherwise the test would fail even if the face is actually available.

```

400   \maybe@load@fontshape
401   \edef\reserved@a{\f@encoding /\f@family /#1/\f@shape}%
402   \ifcsname \reserved@a \endcsname

```

If the desired result is available then we use that. However, we do need some post-processing because we need to drop surplus `ms` due to the way naming convention was designed in the '90s (sigh).

```

403     \set@target@series{#1}%

```

If not, then we try the alternate result (#2).

```
404 \else
405 \ifcsname \f@encoding /\f@family /#2/\f@shape \endcsname
```

If the alternate result exist we use that and also issue a warning (or rather a log entry) that we didn't managed to change to the desired font.

```
406 \set@target@series{#2}%
407 \@font@shape@subst@warning
```

If that doesn't exist either, then we use the requested series unmodified (again with a warning).

```
408 \else
409 \set@target@series{#3}%
410 \@font@shape@subst@warning
411 \fi
412 \fi
413 \fi
414 }
```

It is possible that the previous font and the new one are actually identical (and the font was not found because it still needs loading) in which case a warning would look rather odd. So we make a quick check for that (which is the reason why we defined \@reserveda above.

```
415 \def\@font@shape@subst@warning{%
416 \edef\reserved@b{\curr@fontshape}%
417 \ifx\reserved@a\reserved@b \else
418 \@font@warning{Font shape '\reserved@a' undefined\MessageBreak
419 using '\reserved@b' instead}%
420 \fi
421 }
```

`\maybe@load@fontshape` A small helper that we use a couple of times: try loading a fontshape (in a group because `\try@load@fontshape` normalizes catcodes).

```
422 \def\maybe@load@fontshape{\begingroup\try@load@fontshape\endgroup}
```

`\set@target@series` Finally the code for normalizing the `\f@series` value.

`\series@drop@one@m` The combined series value determined by the mapping may still contain an m that we have to remove (as the .fd files use c not mc to denote a medium weight condensed series, etc.). We do this in all branches above because a user might have written

```
\DeclareFontSeriesChangeRule {m}{sc}{msc}{mc}
```

instead of using sc and c as needed in the .fd file.

```
423 \def\set@target@series#1{%
```

We need to \edef the argument first in case it starts with a conditional.

```
424 \edef\f@series{#1}%
425 \edef\f@series{\expandafter\series@drop@one@m\f@series mm\series@drop@one@m}%
426 }
```

Drop up to two ms but keep one if that makes the series value empty.

```
427 \def\series@drop@one@m#1m#2m#3\series@drop@one@m{%
428 \ifx\relax#1#2\relax m\else#1#2\fi
429 }
```

29 Changing the shape

Shapes are also split in two axes (though it could be more if that is desirable), essentially building in an “sc” axis).

`\DeclareFontShapeChangeRule` The database for shapes is done in exactly the same way, only that it is much smaller and we usually have no alternative shape (or rather it is empty thus not used).

```
430 \def\DeclareFontShapeChangeRule #1#2#3#4{%
431   \@namedef{shape@#1@#2}{#{#3}-{#4}}}
```

There is kind of the same problem with returning back from `sc` to normal. It sort of needs its own letter. In `fontspec` this was solved by the first time `\upshape` changes `it` or `sl` back (so only `sc` remains) and second time it changes then `sc` back to normal. Maybe that’s not a bad way to handle it, but decided for a slightly different approach: `n` always returns to “normal”, ie resets everything and `up` changes italic or slanted to upright and `ulc` undoes small caps.

So we now offer `\normalshape` (using `\shapedefault` which is normally the same as calling both `\ulcshape` and `\upshape`, only more efficient.

`\ulcshape` To request going back to upper/lowercase we need a new command. It uses `ulc`
`\textulc` as shape name but this shape is virtual, i.e., it doesn’t exist as a real shape, it
`\ulcdefault` is only used as part of the database table entries and thus only appears in the second argument there (but not in the first).

```
432 \DeclareRobustCommand\ulcshape
433       {\not@math@alphabet\ulcshape\relax
434        \fontshape\ulcdefault\selectfont}
435 \newcommand\ulcdefault{ulc}
```

`\swshape` New command to select a swash shape. The standard rules put this in the same
`\textsw` category as italics or slanted, i.e., if you ask for it then italics are undone. One
`\swdefault` could provide more complicated rules so that `it + sw` becomes `swit` but given that there are only very few fonts that have swash letters that level of flexibility (these days) would be just resulting in a lot of combinations that do not exist.

```
436 \DeclareRobustCommand\swshape
437       {\not@math@alphabet\swshape\relax
438        \fontshape\swdefault\selectfont}
439 \newcommand\swdefault{sw}
```

`\sscshape` New command to select spaced small capitals. This is only here because `fontaxes`
`\textssc` offered it. There isn’t a single free font that supports it. However, some commercial
`\sscdefault` ones do, so we offer it so that at some point `fontaxes` could be retired.

So far there aren’t any rules for it—probably there should be some putting it in the same category as `sc`.

```
440 \DeclareRobustCommand\sscshape
441       {\not@math@alphabet\sscshape\relax
442        \fontshape\sscdefault\selectfont}
443 \newcommand\sscdefault{ssc}
```

29.1 Mapping rules for shape combinations

Many of the entries are commented out as we will get that result without any entry.

```
444 %\DeclareFontShapeChangeRule {n}{n} {n} {}
445 \DeclareFontShapeChangeRule {n}{it} {it} {sl}
446 \DeclareFontShapeChangeRule {n}{sl} {sl} {it}
447 %\DeclareFontShapeChangeRule {n}{sw} {sw} {}
448 %\DeclareFontShapeChangeRule {n}{sc} {sc} {}
449 \DeclareFontShapeChangeRule {n}{ulc} {n} {}
450 \DeclareFontShapeChangeRule {n}{up} {n} {}

451 %\DeclareFontShapeChangeRule {it}{n} {n} {}
452 %\DeclareFontShapeChangeRule {it}{it} {it} {}
453 \DeclareFontShapeChangeRule {it}{sl} {sl} {it}
454 %\DeclareFontShapeChangeRule {it}{sw} {sw} {}
```

If neither `scit` nor `scsl` exist then `sc` will be used as a fallback albeit with a log entry, so except for the latter there will be no change for CM or Latin Modern fonts.

```
455 \DeclareFontShapeChangeRule {it}{sc} {scit} {scsl}
456 \DeclareFontShapeChangeRule {it}{ulc} {it} {}
457 \DeclareFontShapeChangeRule {it}{up} {n} {}

458 %\DeclareFontShapeChangeRule {sl}{n} {n} {}
459 \DeclareFontShapeChangeRule {sl}{it} {it} {sl}
460 %\DeclareFontShapeChangeRule {sl}{sl} {sl} {}
461 %\DeclareFontShapeChangeRule {sl}{sw} {sw} {}
462 \DeclareFontShapeChangeRule {sl}{sc} {scsl} {scit}
463 \DeclareFontShapeChangeRule {sl}{ulc} {sl} {}
464 \DeclareFontShapeChangeRule {sl}{up} {n} {}

465 %\DeclareFontShapeChangeRule {sc}{n} {n} {}
466 \DeclareFontShapeChangeRule {sc}{it} {scit} {scsl}
467 \DeclareFontShapeChangeRule {sc}{sl} {scsl} {scit}
468 \DeclareFontShapeChangeRule {sc}{sw} {scsw} {sw}
469 %\DeclareFontShapeChangeRule {sc}{sc} {sc} {}
470 \DeclareFontShapeChangeRule {sc}{ulc} {n} {}
```

The next rule might be a bit surprising and rightly so. Correct would be that `sc` is not affected by `up`, i.e., remains `sc` as showed in the commented out rule. However, for nearly three decades commands such as `sc` or `\textup` changed small caps back to the “normal” shape. So for backward compatibility we keep that behavior.

As a result you are currently typesetting in `scit` or `scsl` using `\upshape` twice will return you to the normal shape too, the first will change to `sc` and the second (because of the rule below) change that to `n`. This is the way `fontspec` implemented its version on this interface, so this rule means we are also compatible with the way `fontspec` behaved. Still it remains an oddity which I would rather liked to have avoided.

```
471 %\DeclareFontShapeChangeRule {sc}{up} {sc} {}
472 \DeclareFontShapeChangeRule {sc}{up} {n} {}

473 %\DeclareFontShapeChangeRule {scit}{n} {n} {}
474 \DeclareFontShapeChangeRule {scit}{it} {scit} {}
475 \DeclareFontShapeChangeRule {scit}{sl} {scsl} {scit}
```

```

476 \DeclareFontShapeChangeRule {scit}{sw} {scsw} {sc} % or scit?
477 \DeclareFontShapeChangeRule {scit}{sc} {scit} {}
478 \DeclareFontShapeChangeRule {scit}{ulc} {it} {}
479 \DeclareFontShapeChangeRule {scit}{up} {sc} {}

```

The previous rule assumes that if `scit` exists then it exists as well. If not, the mechanism will save `ulc` in `\f@series` which most certainly doesn't exist. So when a font is later selected that would result in a substitution (so no harm done really). Alternatively, we could in this case use `n` as alternative, which may be a bit faster, but such a setup would be so weird in the first place that this isn't worth the effort.

```

480 %\DeclareFontShapeChangeRule {scsl}{n} {n} {}
481 \DeclareFontShapeChangeRule {scsl}{it} {scit} {scsl}
482 \DeclareFontShapeChangeRule {scsl}{sl} {scsl} {}
483 \DeclareFontShapeChangeRule {scsl}{sw} {scsw} {sc} % or scsl?
484 \DeclareFontShapeChangeRule {scsl}{sc} {scsl} {}
485 \DeclareFontShapeChangeRule {scsl}{ulc} {sl} {}
486 \DeclareFontShapeChangeRule {scsl}{up} {sc} {}

487 %\DeclareFontShapeChangeRule {scsw}{n} {n} {}
488 \DeclareFontShapeChangeRule {scsw}{it} {scit} {scsw}
489 \DeclareFontShapeChangeRule {scsw}{sl} {scsl} {}
490 \DeclareFontShapeChangeRule {scsw}{sw} {scsw} {}
491 \DeclareFontShapeChangeRule {scsw}{sc} {scsw} {}
492 \DeclareFontShapeChangeRule {scsw}{ulc} {sw} {}
493 \DeclareFontShapeChangeRule {scsw}{up} {sc} {}

494 %\DeclareFontShapeChangeRule {sw}{n} {n} {}
495 %\DeclareFontShapeChangeRule {sw}{it} {it} {}
496 %\DeclareFontShapeChangeRule {sw}{sl} {sl} {}
497 %\DeclareFontShapeChangeRule {sw}{sw} {sw} {}
498 \DeclareFontShapeChangeRule {sw}{sc} {scsw} {}
499 \DeclareFontShapeChangeRule {sw}{ulc} {sw} {}
500 \DeclareFontShapeChangeRule {sw}{up} {n} {}

```

29.2 Changing to a new shape

`\fontshape` Again the `\fontshape` now has to do a lookup to get to its new value in `\f@shape`. The method is exactly the same as in `\fontseries`.

```
501 \DeclareRobustCommand\fontshape[1]{\merge@font@shape{#1}}
```

`\fontshapeforce` The unconditional version:

```
502 \DeclareRobustCommand\fontshapeforce[1]{\edef\f@shape{#1}}
```

`\merge@font@shape` Look up the database entry (if existing) and act accordingly.

```

503 \def\merge@font@shape#1{%
504   \expandafter\expandafter\expandafter
505   \merge@font@shape@
506   \csname shape@\f@shape @#1\endcsname
507   {#1}%
508   \@nil
509 }

```

`\merge@font@shape@` Same game now, except that we look at shapes not series values and we can set the shape without the complication of dropping “m”s from the name as we had to for the series.

```

510 \def\merge@font@shape@#1#2#3\@nil{%
511   \def\reserved@a{#3}%
512   \ifx\reserved@a\@empty
513     \edef\f@shape{#2}%
514   \else
515     \maybe@load@fontshape
516     \edef\reserved@a{\f@encoding /\f@family /\f@series/#1}%
517     \ifcsname \reserved@a\endcsname
518       \edef\f@shape{#1}%
519     \else
520       \ifcsname \f@encoding /\f@family /\f@series/#2\endcsname
521         \edef\f@shape{#2}%
522         \@font@shape@subst@warning
523       \else
524         \edef\f@shape{#3}%
525         \@font@shape@subst@warning
526       \fi
527     \fi
528   \fi
529 }
```

`\normalshape` `\normalshape` resets both sub-axes if the default rules are used.

```

530 \protected\def\normalshape
531   {\not@math@alphabet\normalshape\relax
532    \fontshape\shapedefault\selectfont}%

```

30 Make sure we win ...

This code implements one aspect of what the package `fontaxes` provide. So its redefinitions for the various shape commands, such as `\itshape` should no longer happen. We therefore force the standard definitions at `\AtBeginDocument` (later when this is defined. Once `fontaxes` is no longer doing such redefinitions that could be taken out again.

We use a separate macro so that we can easily disable this (in case of rollback).

`\reinstall@nfss@defs` I use `\protected` here not `\DeclareRobustCommand` to avoid extra status lines.

```

533 \def\reinstall@nfss@defs{%
534   \protected\def\upshape
535     {\not@math@alphabet\upshape\relax
536      \fontshape\updefault\selectfont}%
537   \protected\def\slshape
538     {\not@math@alphabet\slshape\relax
539      \fontshape\sldefault\selectfont}%
540   \protected\def\scshape
541     {\not@math@alphabet\scshape\relax
542      \fontshape\scdefault\selectfont}%
543   \protected\def\itshape
544     {\not@math@alphabet\itshape\mathit
545      \fontshape\itdefault\selectfont}%

```

```

546 \protected\def\ulcshape
547     {\not@math@alphabet\ulcshape\relax
548      \fontshape{ulc}\selectfont}%
549 \protected\def\swshape
550     {\not@math@alphabet\swshape\relax
551      \fontshape\swdefault\selectfont}%
552 \protected\def\sscshape
553     {\not@math@alphabet\sscshape\relax
554      \fontshape\sscdefault\selectfont}%
555 }

```

Supporting rollback ...

```

File q

ltfsstrc.dtx

31 Introduction

This package contains the code for tracing font loading and font changes. It basically overlays some of the low-level functions of NFSS with additional code used for tracing.

The package accepts the following options:

errorshow Write all information about font changes etc. only to the transcript file unless an error happens. This means that information about font substitution will not be shown on the terminal.

warningshow Show all NFSS warnings on the terminal. This setting corresponds to the default behaviour of NFSS if the `tracefmt` package is *not* loaded!

infoshow Show all NFSS warning and all NFSS info messages (that are normally only written to the transcript file) also on the terminal. This is the default if the `tracefmt` package is loaded.

debugshow In addition to `infoshow` show also changing of math fonts as far as possible (this option can produce a large amount of output).

loading Show the name of external fonts when they are loaded. This option shows only “newly” loaded fonts not those already preloaded in the format or the class file before the `tracefmt` package became active.

pausing Turn all font warnings into errors so that L^AT_EX will stop.

32 A driver for this document

The next bit of code contains the documentation driver file for T_EX, i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

When this file is processed directly by L^AT_EX this will produce the documentation as well.

```
1 (*driver)
2 \documentclass{ltxdoc}
3
4
5 %\OnlyDescription % comment out for implementation details
6
7 \begin{document}
8   \DocInput{ltfsstrc.dtx}
9 \end{document}
10 </driver>
```

33 The Implementation

Warning: Read the macro documentation with a grain of salt. It is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

If we are making a package file it is a good idea to test whether we are running under 2e. This code is actually placed at the very beginning of this file for easier maintenance, thus commented out here.

```
11 (*package)
12 %\NeedsTeXFormat{LaTeX2e}
13 %\ProvidesPackage{tracefnt}[??/??/?? v?.??]
14 %
15 %\Standard LaTeX package (font tracing)]
16 \end{package}
```

The `debug` module makes use of commands contained in a special package file named `trace.sty`.⁴

```
16 \input{trace.sty}
```

34 Handling Options

`\tracingfonts` Here is the definition of the integer register for the font trace. As a default in a package file we use 1 to give error messages if fonts are substituted. If this code is used for debugging or tracing reasons in the format file (i.e. in `fam.dtx`) we use 0 as the default. But if no font trace is used we build a definition that will produce a warning message.

```
17 (*2ekernel)
18 \def\tracingfonts{%
19   \@font@warning{Command \noexpand\tracingfonts
20     not provided.\MessageBreak
21     Use the 'tracefnt' package.\MessageBreak Command found:}%
22   \count@}
23 \end{2ekernel}
```

The `\count@` in the line above will remove the number after `\tracingfonts`. Note that this definition will be overwritten by the next line if one of these modules are included.

```
24 (*package, trace, debug)
25 \newcount\tracingfonts
26 \tracingfonts=0
27 \end{package, trace, debug}
```

The option `errorshow` turns off all warnings so that only real errors are shown. `warningshow` corresponds to the NFSS default (when `tracefnt` is not loaded). `infoshow` is the default for this package here; and `debugshow`, `loading`, and `pausing` extend the amount of information even further.

```
28 (*package)
29 \DeclareOption{errorshow}{%
30   \def\@font@info#1{%
31     \GenericInfo{(Font)}\@spaces\@spaces\@spaces\space\space}%
32   }
33 \end{package}
```

⁴This package is not in distribution at the moment (and probably doesn't any longer work). Think of this part of the code as being historical artefacts.

```

32             {LaTeX Font Info: \space\space\space#1}}%
33   \def\@font@warning#1{%
34     \GenericInfo{(Font)\@spaces\@spaces\@spaces\space\space}%
35     {LaTeX Font Warning: #1}}%
36   }

37 \DeclareOption{warningshow}{%
38   \def\@font@info#1{%
39     \GenericInfo{(Font)\@spaces\@spaces\@spaces\space\space}%
40     {LaTeX Font Info: \space\space\space#1}}%
41   \def\@font@warning#1{%
42     \GenericWarning{(Font)\@spaces\@spaces\@spaces\space\space}%
43     {LaTeX Font Warning: #1}}%
44   }

45 \DeclareOption{infoshow}{%
46   \def\@font@info#1{%
47     \GenericWarning{(Font)\@spaces\@spaces\@spaces\space\space}%
48     {LaTeX Font Info: \space\space\space#1}}%
49   \def\@font@warning#1{%
50     \GenericWarning{(Font)\@spaces\@spaces\@spaces\space\space}%
51     {LaTeX Font Warning: #1}}%
52   }

53 \DeclareOption{loading}{%
54   \tracingfonts\tw@
55   }

56 \DeclareOption{debugshow}{%
57   \ExecuteOptions{infoshow}%
58   \tracingfonts\thr@@
59   }

60 \DeclareOption{pausing}{%
61   \def\@font@warning#1{%
62     \GenericError
63     {(Font)\@spaces\@spaces\@spaces\space\space}%
64     {LaTeX Font Warning: #1}%
65     {See the LaTeX Companion for details.}%
66     {I'll stop for every LaTeX Font Warning because
67     you requested\MessageBreak the 'pausing' option
68     to the tracefmt package.}}%
69   }

```

We make `infoshow` the default, which in turn defines `\font@warning` and `\font@info`.

```

70 \ExecuteOptions{infoshow}
71 \ProcessOptions
72 \endpackage

```

We also need a default definition inside the kernel:

```

73 \ifx\kernel
74   \def\@font@info#1{%
75     \GenericInfo{(Font)\@spaces\@spaces\@spaces\space\space}%
76     {LaTeX Font Info: \space\space\space#1}}%
77   \def\@font@warning#1{%
78     \GenericWarning{(Font)\@spaces\@spaces\@spaces\space\space}%

```

```

79                                     {LaTeX Font Warning: #1}}%
80 </2ekernel>

```

35 Macros common to fam.tex and tracefmt.sty

In the first versions of `tracefmt.dtx` some macros of `fam.dtx`⁵ were redefined to included the extra tracing information. Now these macros are all defined in this file (i.e. removed from `fam.dtx`) and different production versions can be obtained simply by specifying a different set of modules to include when generating `lftss.dtx`.

35.1 General font loading

`\extract@font` This macro organizes the font loading. It first calls `\get@external@font` which will return in `\external@font` the name of the external font file (the .tfm) as it was determined by the NFSS tables.

```

81 <*2ekernel | package>
82 \def\extract@font{%
83   \get@external@font

```

Then the external font is loaded and assigned to the font identifier stored inside `\font@name` (for this reason we need `\expandafter`).

```

84   \global\expandafter\font\font@name\external@font\relax

```

When tracing we typeout the internal and external font name.

```

85 <*trace>
86   \ifnum \tracingfonts >\@ne
87     \@font@info{External font '\external@font'
88               loaded as\MessageBreak \font@name}\fi
89 </trace>

```

Finally we call the corresponding “loading action” macros to finish things. First the font is locally selected to allow the use of `\font` inside the loading action macros.

```

90   \font@name \relax

```

The next two lines execute the “loading actions” for the family and then for the individual font shape.

```

91   \csname \f@encoding+\f@family\endcsname
92   \csname\curr@fontshape\endcsname
93   \relax
94   }
95 </2ekernel | package>

```

The `\relax` at the end needs to be explained. This is inserted to prevent `TEX` from scanning too far when it is executing the replacement text of the loading code macros.

`\get@external@font` This function tries to find an external font name. It will place the name into the macro `\external@font`. If no font is found it will return the one that was defined via `\DeclareErrorFont`.

```

96 <*2ekernel>
97 \def\get@external@font{%

```

⁵This file is currently not distributed in documented form. Its code is part of `lftss.dtx`.

We don't know the external font name at the beginning.

```

98   \let\external@font\@empty
99   \edef\font@info{\expandafter\expandafter\expandafter\string
100     \csname \curr@fontshape \endcsname}%
101   \try@size@range

```

If this failed, we'll try to substitute another size of the same font. This is done by the `\try@size@substitution` macro. It “knows about” `\do@extract@font`, `\font@name`, `\f@size`, and so on.

```

102   \ifx\external@font\@empty
103     \try@size@substitution
104     \ifx\external@font\@empty
105       \@latex@error{Font \expandafter \string\font@name\space
106         not found}\@eha
107       \error@fontshape
108       \get@external@font
109   \fi\fi
110 }
111 \</2ekernel>

```

`\selectfont` The macro `\selectfont` is called whenever a font change must take place.

```

112 (*2ekernel | package)
113 \DeclareRobustCommand\selectfont
114   {%

```

When `debug` is specified we actually want something like ‘undebug’. The font selection is now stable so that using `\tracingall` on some other macros will show us a lot of unwanted information about font loading. Therefore we disable tracing during font loading as long as `\tracingfonts` is less than 4.

```

115 (+debug) \pushtracing
116 (+debug) \ifnum\tracingfonts<4 \tracingoff
117 (+debug) \else \tracingon\p@selectfont \fi

```

If `\baselinestretch` was redefined by the user it will not longer match its internal counterpart `\f@linespread`. If so we call `\set@fontsize` to prepare `\size@update`.

```

118   \ifx\f@linespread\baselinestretch \else
119     \set@fontsize\baselinestretch\f@size\f@baselineskip \fi

```

Then we generate the internal name of the font by concatenating *family*, *series*, *shape*, and current *size*, with slashes as delimiters between them. This is much more readable than standard L^AT_EX's `\twfbf`, etc. We define `\font@name` globally, as always. The reason for this is explained later on.

```

120   \xdef\font@name{%
121     \csname\curr@fontshape/\f@size\endcsname}%

```

We call the macro `\pickup@font` which will load the font if necessary.

```

122   \pickup@font

```

Then we select the font.

```

123   \font@name

```

If `\tracingfonts` is greater than 2 we also show the font switch. We do this before `\glb@settings` is called since this macro might redefine `\font@name`.

```

124 (*trace)

```

```

125     \ifnum \tracingfonts>\tw@
126         \font@info{Switching to \font@name}\fi
127 \end{trace}

```

Finally we call `\size@update`. This macro is normally empty but will contain actions (like setting the `\baselineskip`) that have to be carried out when the font size, the base `\baselineskip` or the `\baselinestretch` have changed.

```

128     \size@update

```

A similar function is called to handle anything related to encoding updates. This one is changed from `\relax` by `\fontencoding`.

```

129     \enc@update

```

Just before ending this macro we have to pop the tracing stack if it was pushed before.

```

130 \ifx\debug\poptracing
131 \fi

```

`\set@fontsize` The macro `\set@fontsize` does the actual work. First it assigns new values to `\f@size`, `\f@baselineskip` and `\f@linespread`.

```

132 \def\set@fontsize#1#2#3{%
133     \@defaultunits\@tempdimb#2pt\relax\@nnil
134     \edef\f@size{\strip@pt\@tempdimb}%
135     \@defaultunits\@tempskipa#3pt\relax\@nnil
136     \edef\f@baselineskip{\the\@tempskipa}%
137     \edef\f@linespread{#1}%

```

For backward compatibility and for later testing within `\selectfont` the internal value of `\f@linespread` is passed back to `\baselinestretch`.

```

138     \let\baselinestretch\f@linespread

```

Additional processing will happen within `\selectfont`. For this reason the macro `\size@update` (which will be called in `\selectfont`) will be defined to be:

```

139     \def\size@update{%

```

First calculate the new `\baselineskip` and also store it in `normalbaselineskip`

```

140         \baselineskip\f@baselineskip\relax
141         \baselineskip\f@linespread\baselineskip
142         \normalbaselineskip\baselineskip

```

then to set up a new `\strutbox`

```

143         \setbox\strutbox\hbox{%
144             \vrule\@height.7\baselineskip
145             \@depth.3\baselineskip
146             \@width\z@}%

```

We end with a bit of tracing information.

```

147 \ifx\trace\@empty
148     \ifnum \tracingfonts>\tw@
149         \ifx\f@linespread\@empty
150             \let\reserved@a\@empty
151         \else
152             \def\reserved@a{\f@linespread x}%
153         \fi
154         \font@info{Changing size to \f@size/\reserved@a
155             \f@baselineskip}%
156         \aftergroup\type@restoreinfo \fi
157 \end{trace}

```

When all this is processed `\size@update` redefines itself to `\relax` so that in later calls of `\selectfont` no extra code will be executed.

```
158      \let\size@update\relax}%
159  }
```

Instead of defining this macro internally we might speed things up by placing the code into a separate macro and use `\let`!

`\size@update` Normally this macro does nothing; it will be redefined by `\set@fontsize` to initiate an update.

```
160 \let\size@update\relax
```

`\type@restoreinfo` This macro produces some info when a font size and/or baseline change will get restored.

```
161 (*trace)
162   \def\type@restoreinfo{%
163     \ifx\f@linespread\@empty
164       \let\reserved@a\@empty
165     \else
166       \def\reserved@a{\f@linespread x}%
167     \fi
168     \@font@info{Restoring size to
169                \f@size/\reserved@a\f@baselineskip}}
170 (/trace)
```

`\glb@settings` The macro `\glb@settings` globally selects all math fonts for the current size if necessary.

```
171 \def\glb@settings{%
```

When `\glb@settings` gains control a size change was requested and all previous font assignments need to be replaced. Therefore the old values of the fonts are no longer needed. For every *math group* the new assignments are appended to `\math@fonts`. But this happens only if the `math@fonts` switch is set to true. However, we always set up the correct math sizes for script and scriptscript fonts since they may be needed even if we don't set up the whole math machinery.

Here we set the math size, script size and scriptscript size. If the `S@...` macro is not defined we have to first calculate the three sizes.

```
172   \expandafter\ifx\csname S@\f@size\endcsname\relax
173     \calculate@math@sizes
174   \fi
```

The effect of this is that `\calculate@math@sizes` may or may not define the `S@...` macro. In the first case the next time the same size is requested this macro is used, otherwise `\calculate@math@sizes` is called again. This also sets the `math@fonts` switch. If it is true we must switch the math fonts.

```
175   \csname S@\f@size\endcsname
176   \ifmath@fonts
177 (*trace)
178   \ifnum \tracingfonts>\tw@
179     \@font@info{Setting up math fonts for
180                \f@size/\f@baselineskip}\fi
181 (/trace)
```

Inside a group we execute the macro for the current math *version*. This sets `\math@fonts` to a list of `\textfont...` assignments. `\getanddefine@fonts` (which may be called at this point) needs the `\escapechar` parameter to be set to `-1`.

```
182      \begingroup
183      \escapechar\m@ne
184      \csname mv@\math@version \endcsname
```

Then we set `\globaldefs` to 1 so that all following changes are done globally. The math font assignments recorded in `\math@fonts` are executed and `\glb@currrsize` is set equal to `\f@size`. This signals that the fonts for math in this size are set up.

```
185      \globaldefs\@ne
186      \math@fonts
187      \let \glb@currrsize \f@size
188      \endgroup
```

Finally we execute any code that is supposed to happen whenever the math font setup changes. This register will be executed in local mode which means that everything that is supposed to have any effect should be done globally inside. We can't execute it within `\globaldefs\@ne` as we don't know what ends up inside this register, e.g., it might contain calculations which use some local registers to calculate the final (global) value.

```
189      \the\every@math@size
```

Otherwise we announce that the math fonts are not set up for this size.

```
190 (*trace)
191      \else
192          \ifnum \tracingfonts>\tw@
193              \@font@info{No math setup for
194                          \f@size/\f@baselineskip}\fi
195      \trace)
196      \fi
197  }
198  \endkernel | package)
```

`\baselinestretch` In `\selectfont` we used `\baselinestretch` as a factor when assigning a value to `\baselineskip`. We use 1 as a default (i.e. no stretch).

```
199 (*2ekernel)
200 \def\baselinestretch{1}
```

`\every@math@size` We must still define the hook `\every@math@size` we used in `\glb@settings`. We initialize it to nothing. It is important to remember that everything that goes into this hook should to global updates, local changes will have weird effects.

```
201 \newtoks\every@math@size
202 \every@math@size={}
203 \endkernel
```

35.2 Math fonts setup

35.2.1 Outline of algorithm for math font sizes

$\mathrm{T}_{\mathrm{E}}\mathrm{X}$ uses the math fonts that are current when the end of a formula is reached. If we don't want to keep font setups local to every formula (which would result in

an enormous overhead, we have to be careful not to end up with the wrong setup in case formulas are nested, e.g., we need to be able to handle

```
$ a=b+c \mbox{ \small for all $b$ and $c$ in $Z$ }$
```

Here the inner formulae `b` and `c\in Z` are typeset in `\small` but we have to return to `\normalsize` before we reach the closing `$` of the outer formula.

This is handled in the following way:

1. At any point in the document the global variable `\gbl@currsiz` contains the point size for which the math fonts currently are set up.
2. Whenever we start a formula we compare its value with the local variable `\f@size` that describes the current text font size.
3. If both are the same we assume that we can use the current math font setup without adjustment.
4. If they differ we call `\gbl@settings` which changes the math font setup and updates `\gbl@currsiz`.
 - (a) If we are recursively inside another formula (`\if@inmath`) we ensure that `\gbl@settings` is executed again in the outer formula, so that the old setup is automatically restored.
 - (b) Otherwise, we set the switch `@inmath` locally to `true` so that all nested formulae will be able to detect that they are nested in some outer formula.

The above algorithm has the following features:

- For sizes which are not containing any formula no math setup is done. Compared to the original algorithm of NFSS this results in the following savings:
 - No unnecessary loading of math fonts for sizes that are not used to typeset any math formulae (explicit or implicit ones).
 - No time overhead due to unnecessary changes of the math font setup on entrance and exit of the text font size.
- Math font setup changes for top-level formulae will survive (there is no restoration after the formula) thus any following formula in the same size will be directly typesettable. Compared to original implementation in NFSS2 the new algorithm has the overhead of one test per formula to see if the current math setup is valid (in the original algorithm the setup was always valid, thus no test was necessary).
- In nested formulae the math font setup is restored in the outer formula by a series of `\aftergroup` commands and checks. Compared to the original algorithm this involves additional checks ($2 \times \langle \text{non-math levels} \rangle$ per inner formula).

35.2.2 Code for math font size setting

`\check@mathfonts` In the `\check@mathfonts` macros we implement the steps 2 to 4 except that instead of a switch the macro `\init@restore@glb@settings` is used.

```

204 (*2kernel|package)
205 \def\check@mathfonts{%
206   \ifx \glb@currsiz \f@size
207   (*trace)
208     \ifnum \tracingfonts>\thr@@
209       \@font@info{*** MATH: no change \f@size\space
210         curr/global (\curr@math@size/\glb@currsiz)}\fi
211   (/trace)
212   \else
213   (*trace)
214     \ifnum \tracingfonts>\thr@@
215       \@font@info{*** MATH: setting up \f@size\space
216         curr/global (\curr@math@size/\glb@currsiz)}\fi
217   (/trace)
218     \glb@settings
219     \init@restore@glb@settings
220   \fi
221   \let\curr@math@size\f@size
222   \def\init@restore@glb@settings{\aftergroup\restglb@settings}%
223 }
```

`\init@restore@glb@settings` This macros does by default nothing but get redefined inside `\check@mathfonts` to initiate fontsize restoring in nested formulas.

```

224 (-trace)\let\init@restore@glb@settings\relax
225 (*trace)
226 \def\init@restore@glb@settings{%
227   \ifnum \tracingfonts>\thr@@
228     \@font@info{*** MATH: no resetting (not in
229       nested math)}\fi
230 }
231 (/trace)
```

`\restglb@settings` This macro will be executed the first time after the current formula.

```

232 \def\restglb@settings{%
233   (*trace)
234     \ifnum \tracingfonts>\thr@@
235       \@font@info{*** MATH: restoring}\fi
236   (/trace)
237     \begingroup
238       \let\f@size\curr@math@size
239       \ifx\glb@currsiz \f@size
240   (*trace)
241     \ifnum \tracingfonts>\thr@@
242       \@font@info{*** MATH: ... already okay (\f@size)}\fi
243   (/trace)
244     \else
245   (*trace)
246     \ifnum \tracingfonts>\thr@@
247       \@font@info{*** MATH: ... to \f@size}\fi
248   (/trace)
```

```

249         \glb@settings
250     \fi
251 \endgroup
252 }

```

35.2.3 Other code for math

`\use@mathgroup` The `\use@mathgroup` macro should be used in user macros to select a math group. Depending on whether or not the `margid` option is in force it has two or three arguments. For this reason it should be called as the last macro.

First we test if we are inside math mode since we don't want to apply a useless definition.

```

253 \def\use@mathgroup#1#2{\relax\ifmmode

254 (*trace)
255   \ifnum \tracingfonts>\tw@
256     \count@#2\relax
257     \@font@info{Using \noexpand\mathgroup
258               (\the\count@) #2}\fi
259 }/trace)

```

If so we first call the '=' macro (i.e. argument three) to set up special things for the selected math group. Then we call `\mathgroup` to select the group given by argument two and finally we place `#1` (i.e. the argument of the *math alphabet identifier*) at the end. This part of the code is surrounded by two commands which behave like `\begingroup` and `\endgroup` if we want *math alphabet identifier*s but will expand into `\@empty` if we want simply switches to a new math group. Since argument number 2 may be a digit instead of a control sequence we add a `\relax`. Otherwise something like `\mit{1}` would switch to math group 11 (and back) instead of printing an oldstyle 1.

```

260     \math@bgroup
261     \expandafter\ifx\csname M@f@encoding\endcsname#1\else
262     #1\fi
263     \mathgroup#2\relax

```

Before we reinsert the swallowed token (arg. three) into the input stream, in the case that the *math alphabet identifier* isn't called in math mode, we remove the `\fi` with the `\expandafter` trick. This is necessary if the token is actually an macro with arguments. In such a case the `\fi` will be misinterpreted as the first argument which would be disastrous.

```

264     \expandafter\math@egroup\fi}%

```

The surrounding macros equal `\begingroup` and `\endgroup`. But using internal names makes it possible to overwrite their meaning in certain cases. This is for example used in \TeX macros for placing accents.

`\math@egroup` If the `margid` option is in force (which can be tested by looking at the definition of `\math@bgroup` we change the `\math@egroup` command a bit to display the current *math group number* after it closes the scope of *math alphabet* with `\endgroup`.

```

265 (*trace)
266   \ifx\math@bgroup\bgroup
267     \def\math@egroup#1{#1\egroup

```

```

268     \ifnum \tracingfonts>\tw@
269     \@font@info{Restoring \noexpand\mathgroup
270       (\ifnum\mathgroup=\m@ne default\else \the\mathgroup \fi)%
271       }\fi}
272   \fi
273 \trace)

```

`\getanddefine@fonts` `\getanddefine@fonts` has two arguments: the *(math group number)* and the *family/series/shape* name as a control sequence.

```

274 \def\getanddefine@fonts#1#2{%

```

First we turn of tracing when `\tracingfonts` is less than 4.

```

275 (+debug) \pushtracing
276 (+debug) \ifnum\tracingfonts<4 \tracingoff
277 (+debug) \else \tracingon\getanddefine@fonts \fi

```

```

278 (*trace)
279 \ifnum \tracingfonts>\tw@
280 \count@#1\relax
281 \@font@info{\noexpand\mathgroup (\the\count@) #1 :=\MessageBreak
282   \string#2 \tf@size/\sf@size/\ssf@size}\fi
283 \trace)

```

We append the current `\tf@size` to `#2` to obtain the font name.⁶ Again, `font@name` is defined globally, for the reasons explained in the description of `\wrong@fontshape`.

```

284 \xdef\font@name{\csname \string#2/\tf@size\endcsname}%

```

Then we call `\pickup@font` to load it if necessary. We remember the internal name as `\textfont@name`.

```

285 \pickup@font \let\textfont@name\font@name

```

Same game for `\scriptfont` and `\scriptscriptfont`:

```

286 \xdef\font@name{\csname \string#2/\sf@size\endcsname}%
287 \pickup@font \let\scriptfont@name\font@name
288 \xdef\font@name{\csname \string#2/\ssf@size\endcsname}%
289 \pickup@font

```

Then we append the new `\textfont...` assignments to the `\math@fonts`.

```

290 \edef\math@fonts{\math@fonts
291   \textfont#1\textfont@name
292   \scriptfont#1\scriptfont@name
293   \scriptscriptfont#1\font@name}%

```

Just before ending this macro we have to pop the tracing stack if it was pushed before.

```

294 (+debug) \poptracing
295   }
296 \endkernel | package)

```

⁶One might ask why this expansion does not generate a macro name that starts with an additional `\` character. The solution is that `\escapechar` is set to `-1` before `\getanddefine@fonts` is called.

36 Scaled font extraction

`\ifnot@nil` We begin with a simple auxiliary macro. It checks whether its argument is the token `\@nil`. If so, it expands to `\@gobble` which discards the following argument, otherwise it expands to `\@firstofone` which reproduces its argument.

```
297 (*2kernel)
298 \def\ifnot@nil#1{\def\reserved@a{#1}%
299 \ifx\reserved@a\@nil \expandafter\@gobble
300 \else \expandafter\@firstofone\fi}
```

`\remove@to@nnil` Three other auxiliary macros will be needed in the following: `\remove@to@nnil` gobbles up everything up to, and including, the next `\@nnil` token, and `\remove@angles` and `\remove@star` do the same for the character `>` and `*`, respectively, instead of `\@nnil`.

```
301 \def\remove@to@nnil#1\@nnil{}
302 \def\remove@angles#1>{\set@simple@size@args}
303 \def\remove@star#1*{#1}
```

`\extract@sizefn` This macro takes a size specification and parses it into size function and the optional and mandatory arguments.

```
304 \def\extract@sizefn#1*#2\@nnil{%
305 \if>#2>\set@size@func@args#1\@nnil
306 \let\sizefn@info\empty
307 \else\expandafter\set@size@func@args\remove@star#2\@nnil
308 \def\sizefn@info{#1}\fi
309 }
```

`\try@simple@size` This function tries to extract the given size (specified by `\f@size`) for the requested font shape. The font information must already be present in `\font@info`. The central macro that does the real work is `\extract@fontinfo`. We will first give a simple example how this macro works, and describe it in full generality later.

Assume that the requested parameters are: *encoding scheme* ‘OT1’, *family* ‘cm’, *series* ‘sansserif’, *shape* ‘normal’, and *size* ‘12’. The corresponding font definitions have already been extracted from the macro `\OT1/cm/sansserif/normal` and stored in `font@info`. (Otherwise `\extract@fontinfo` doesn’t get called.) This information consists of a token list made of characters of category code 12 of the form

```
<10*>cmss10<12*>cmss12<17*>cmss17
```

For reasonable packages one usually needs more sizes but this is sufficient to get the flavour. We will define a macro `\extract@fontinfo` to find the external font name (‘cmss12’) for us:

```
\def\extract@fontinfo#1<12*#2>#3<#4\@nnil{%
\set@simple@size@args#3<#4\@nnil
\execute@size@function{#2}}
```

so that when it gets called via

```
\extract@fontinfo<10*>cmss10<12*>cmss12<17*>cmss17\@nnil
```

#1 will contain all characters before <12*>, #2 will be empty, #3 will be exactly cmss12, and #3 will be 17>cmss17. The expansion is therefore

```
\set@simple@size@args cmss12<17*>cmss17\@nnil
\execute@size@function{}
```

This means: the default (empty) size function will be executed, with its optional argument set to empty and its mandatory argument set to cmss12 by \set@simple@size@args. As we discussed earlier, the effect of the default size function is to load the given external font (cmss12) at the specified size (12)—which is exactly what was intended.

But this is only part of the whole story. It may be that the size requested does not occur in the token list \font@info. And the simple definition of \extract@fontinfo we gave above does not allow to specify give more than one size specification in front of the external font name.

Let's address these two problems separately. The first one is solved with the following trick: We define \extract@fontinfo as follows:

```
\def\extract@fontinfo#1<12*#2>#3<#4\@nnil{%
  \ifnot@nil{#3}%
    {\set@simple@size@args#3<#4\@nnil
      \execute@size@function{#2}%
    }}%
```

How does this work? We call \extract@fontinfo via

```
\expandafter\extract@fontinfo\font@info<12*>\@nil<\@nnil
```

i.e. by appending <12*>\@nil<\@nnil. If the size ('12' in this case) appears in \font@info everything works as explained above, the only difference being that argument #4 of \extract@fontinfo additionally gets the tokens <12*>\@nil<\@nnil. However, if the size is not found everything up to the final <12*> is in argument #1, #3 gets \@nil, and #2 and #4 are empty. The macro \ifnot@nil will discard the calls to \set@simple@size@args and execute@size@function, and hence \font@info will continue to be equal to \@empty. This means that no simple size specification matching the requested size could be found.

The second problem (more than one simple size specification for one external font name) will be addressed in \set@simple@size@args below.

The macros are hidden inside other control sequences so that we have to build \extract@fontinfo in several steps.

So here's the actual definition of \extract@font in \try@simple@size.

```
310 % % this could be replaced by \try@size@range making the subst slower!
```

```
311 \def\try@simple@size{%
```

\reserved@a is made an abbreviation for the head of the definition of the macro \extract@fontinfo.

```
312   \def\reserved@a{\def\extract@fontinfo###1}%
```

Now we can define \extract@fontinfo. Here we handle a small but convenient variation: in case of the default (empty) size function it is allowed to omit the * character.

```
313   \expandafter\reserved@a\expandafter<\f@size>##2<##3\@nnil{%
```

```
314     \ifnot@nil{##2}%
```

```

315         {\set@simple@size@args##2<##3\@nnil
316         \execute@size@function\sizefn@info
317         }}%

```

Now we call `\extract@fontinfo`. Note the `<\@nil` tokens at the end.

```

318     \expandafter\expandafter
319     \expandafter\extract@fontinfo\expandafter\font@info
320     \expandafter<\f@size>\@nil<\@nnil
321 }

```

`\set@simple@size@args` As promised above, the macro `\set@simple@size@args` will handle the case of several size specifications in a row. If another size specification follows, the very first token of its argument list is the character `<`. By starting the definition as follows,

```

322 \def\set@simple@size@args#1<{%

```

parameter `#1` is empty in this case, and contains the size function's arguments otherwise. We distinguish these two cases (Note that the character `<` cannot appear in `#1`) by calling `\remove@angles` for empty `#1` and `\extract@sizefn` otherwise. In the latter case we have to take care of the remaining character tokens and discard them. This is done by `\remove@to@nnil`. Note also the use of Kabelschacht's method.

```

323         \if<#1<%
324         \expandafter\remove@angles
325         \else
326         \extract@sizefn#1*\@nil
327         \expandafter\remove@to@nnil
328         \fi}

```

Now, we are through with the case of a simple size, except for calling the size function. This will be handled later, as it is the same mechanism for all types of size specification. We will now proceed to macros for extraction of size range specification.

`\extract@rangefontinfo` `\extract@rangefontinfo` goes through a font shape definition in the input until it recognizes the tokens `<\@nil->`. It looks for font ranges with font size functions. It's operation is rather simple: it discards everything up to the next size specification and passes this on to `\is@range` for inspection. The specification (parameter `#2` is inserted again, in case it is needed later.

```

329 \def\extract@rangefontinfo#1<#2>{%
330     \is@range#2->\@nil#2>}

```

`\is@range` `\is@range` is again a sort of dispatcher macro: if the size specification it is looking at is not a range specification it discards it and calls `\extract@rangefontinfo` to continue the search. Otherwise it calls `\check@range` to check the requested size against the specified range.

From the way `\is@range` is called inside `\extract@rangefontinfo` we see that `#2` is the character `>` if the size specification found is a simple one (as it does not contain a `-` character. This is checked easily enough and `\extract@rangefontinfo` called again. Note that the extra tokens inserted after the `\@nil` in the call to `\is@range` appear at the beginning of the first argument to `\extract@rangefontinfo` and are hence ignored.

```

331 \def\is@range#1-#2\@nil{%
332   \if>#2\expandafter\check@single\else
333     \expandafter\check@range\fi}

```

`\check@range` `\check@range` takes lower bound as parameter #1, upper bound as #2, size function as #3 and the size function's arguments as #4. If #3 is the special token `\@nil` `\font@info` is exhausted and we can stop searching.

```

334 \def\check@range#1-#2>#3<#4\@nnil{%
335   \ifnot@nil{#3}{%

```

If #3 wasn't `\@nil` we have a range. We start by assuming that we have to recurse. Note that we have to reinsert an `<` as it was already removed by scanning.

```

336     \def\reserved@f{\extract@rangefontinfo<#4\@nnil}%

```

We have to make sure that both boundaries are present, if not we have to set them. Here we check the upper bound. If `\upper@bound` is zero after the assignment we set it to `\maxdimen` (upper open range). We need to use a *dimen* register for the scan since we may have a decimal number as the boundary.

```

337     \upper@bound0#2\p@
338     \ifdim\upper@bound=\z@ \upper@bound\maxdimen\fi

```

Now we check the upper boundary against `\f@size`. If it is larger or equal than `\f@size` this range is no good and we have to recurse.

```

339     \ifdim \f@size \p@<\upper@bound

```

Otherwise we have to check the lower bound. This time it is not necessary to scan the boundary value into a register because if it is empty we get zero as desired. We could even omit the 0 which would result in `1pt` as default lower boundary. If `\f@size` is smaller than the boundary we have to recurse.

```

340         \lower@bound0#1\p@
341         \ifdim \f@size \p@<\lower@bound
342         \else

```

If both tests are passed we can try executing the size function.

```

343         \set@simple@size@args#3<#4\@nnil
344         \execute@size@function\sizefn@info

```

If the function was successful it should have left an external font name in `\external@font`. We use this to see if we can stop scanning. Otherwise we recurse.

```

345         \ifx\external@font\@empty
346         \else
347         \let\reserved@f\@empty
348         \fi
349     \fi
350 \fi
351 \reserved@f}}

```

`\lower@bound` We use two *dimen* registers `\lower@bound` and `\upper@bound` to store the lower
`\upper@bound` and upper endpoints of the range we found.

```

352 \newdimen\lower@bound
353 \newdimen\upper@bound

```

`\check@single` `\check@single` takes the size as parameter `#1`, size function as `#2` and the size function's arguments as `#3`. We can assume that there is always something in the pipeline since the very last entry is a faked range (see above).

```
354 \def\check@single#1>#2<#3\@nnil{%
```

We start by assuming that we have to recurse. Note that we have to reinsert an `<` as it was already removed by scanning.

```
355 \def\reserved@f{\extract@rangefontinfo<#3\@nnil}%
```

Now we check the size against `\f@size`. If it is not equal `\f@size` it is no good and we have to recurse.

```
356 \ifdim \f@size \p@=#1\p@
```

Otherwise if this test is passed we can try executing the size function.

```
357 \set@simple@size@args#2<#3\@nnil
```

```
358 \execute@size@function\sizefn@info
```

If the function was successful it should have left an external font name in `\external@font`. We use this to see if we can stop scanning. Otherwise we recurse.

```
359 \ifx\external@font\@empty
```

```
360 \else
```

```
361 \let\reserved@f\@empty
```

```
362 \fi
```

```
363 \fi
```

```
364 \reserved@f}
```

`\set@size@funct@args` This macro sets the optional and mandatory arguments for a size function. If the optional argument is not present it is set to the empty token list. The mandatory argument is delimited by the token `\@nil`.

```
365 \def\set@size@funct@args{\@ifnextchar[%
```

```
366 \set@size@funct@args@{\set@size@funct@args@[]}}
```

```
367 \def\set@size@funct@args@[#1]#2\@nil{%
```

```
368 \def\mandatory@arg{#2}%
```

```
369 \def\optional@arg{#1}}
```

```
370 </2ekernel>
```

`\DeclareSizeFunction` This function defines a new size function hiding the internal from the designer. The body of the size function may use `\optional@arg` and `\mandatory@arg` denoting the optional and mandatory argument that may follow the size specification `<...>`.

```
371 <*2ekernel>
```

```
372 \def\DeclareSizeFunction#1#2{\@namedef{s@fct@#1}{#2}}
```

```
373 \@onlypreamble\DeclareSizeFunction
```

```
374 </2ekernel>
```

`\execute@size@function` This macro is very simple. The only point worth noting is that calling an undefined size function will do nothing (actually execute a `\relax`).

```
375 <*2ekernel | package>
```

```
376 \def\execute@size@function#1{%
```

```
377 <*trace>
```

```
378 \ifundefined{s@fct@#1}%
```

```
379 {\errmessage{Undefined font size function #1}%
```

```

380         \s@fct@}%
381         {\csname s@fct@#1\endcsname}%
382 \trace)
383 (-trace)      \csname s@fct@#1\endcsname
384 }
385 \endkernel | package)

```

\try@size@range This macro tries to find a suitable range for requested size (specified by `\f@size`) in `\font@info`. All the relevant action is done in `\extract@rangefontinfo`. All that needs to be done is to stuff in the token list in `\font@info` so that `\extract@rangefontinfo` can inspect it. Note the `<-*\@nil>` token at the end to stop scanning.

```

386 (*2kernel)
387 \def\try@size@range{%
388     \expandafter\extract@rangefontinfo\font@info <-*\@nil>\@nnil
389 }

```

\try@size@substitution This is the last thing that can be tried. If the desired `\f@size` is found neither among the simple size specifications nor in one of the ranges the whole list of size specifications is searched for a nearby simple size.

```

390 \gdef\try@size@substitution{%

```

First we do some initializations. `\@tempdimb` will hold the difference between the wanted size and the best solution found so far, so we initialise it with `\maxdimen`. The macro `\best@size` will hold the best size found, nothing found is indicated by the empty value.

```

391 \@tempdimb \maxdimen
392 \let \best@size \@empty

```

Now we loop over the specification

```

393 \expandafter \try@simples \font@info <\number\@M>\@nil<\@nnil
394 }

```

\font@submax The macro `\font@submax` records the maximal deviation from the desired size encountered so far. Its value is used in a warning message at `\end{document}`. The macro **\fontsubfuzz** contains the amount that will not cause terminal warnings (warnings still go into the transcript file).

```

395 \def\font@submax{0pt}
396 \def\fontsubfuzz{.4pt}
397 \endkernel)
398 (+package)\def\fontsubfuzz{0pt}

```

\try@simples `\try@simples` goes through a font shape definition in the input until it recognizes the tokens `<-*\@nil>`. It looks for simple sizes to determine the two closest sizes. It is assumed that simple sizes are in increasing order.

```

399 (*2kernel)
400 \gdef\try@simples#1<#2>{%
401     \tryif@simple#2->\tryif@simple}

```

\tryis@simple `\tryis@simple` is similar to `\is@range`. If it sees a simple size, it checks it against the value of `\f@size` and sets `\lower@font@size` or `\higher@font@size`. In the latter case, it stops the iteration. By adding `<\number\@M>` at the end of the line we always have an end point. This is a hack which probably should be corrected.

First it checks whether it is finished already, then whether the size specification in question is a simple one.

```
402 \gdef\tryif@simple#1-#2\tryif@simple{%
```

Most common case for \reserved@f first:

```
403 \let \reserved@f \try@simples
404 \if>#2%
```

If so, it compares it to the value of \f@size. This is done using a dimen register since there may be fractional numbers.

```
405 \dimen@ #1\p@
406 \ifdim \dimen@<\@M\p@
```

If \dimen@ is \@M\p@ we have reached the end of the fontspec (hopefully) otherwise we compare the value with \f@size and compute in \@tempdimc the absolute value of the difference between the two values.

```
407 \ifdim \f@size\p@<\dimen@
408 \tempdimc \dimen@
409 \advance\tempdimc -\f@size\p@
410 \else
411 \tempdimc \f@size\p@
412 \advance\tempdimc -\dimen@
413 \fi
```

The result is then compared with the smallest difference we have encountered, if the new value (in \@tempdimc is smaller) we have found a size which is a better approximation so we make it the \best@size and adjust \@tempdimb.

```
414 \ifdim \tempdimc<\tempdimb
415 \tempdimb \tempdimc
416 \def \best@size{#1}%
417 \fi
```

When we have reached the end of the fontspec we substitute the best size found (if any). We code this inline to save macro space; in the past this was done by a macro called \subst@size.

```
418 \else
```

\subst@size This macro substitutes the size recorded in \best@size for the unavailable size \f@size. \font@submax records the maximum difference between desired size and selected size in the whole run.

```
419 % \subst@size %% coded inline
420 % \def\subst@size{%
421 \ifx \external@font\@empty
422 \ifx \best@size\@empty
423 \else
424 \ifdim \tempdimb>\font@submax \relax
425 \xdef \font@submax {\the\tempdimb}%
426 \fi
427 \let \f@user@size \f@size
428 \let \f@size \best@size
429 \ifdim \tempdimb>\fontsubfuzz\relax
430 \@font@warning{Font\space shape\space
431 'curr@fontshape'\space in\space size\space
432 <\f@user@size>\space not\space available\MessageBreak
433 size\space <\f@size>\space substituted}%
```

```

434     \fi
435     \try@simple@size
436     \do@subst@correction
437   \fi
438 \fi
439 % %}

```

This brings us back into the main part of `\tryif@simple`. Finally we get rid of any rubbish left over on the input stack.

```

440     \let \reserved@f \remove@to@nnil
441   \fi
442 \fi

```

If it's a range iterate also.

```

443 \reserved@f}

```

36.1 Sizefunctions

In the following we define some useful size functions.

`\s@fct@` This is the default size function. Mandatory argument is an external font name, optional argument a scale factor. The font is scaled to `\f@size` if no optional argument is present, and to `\f@size` multiplied by the optional argument otherwise.

```

444 \DeclareSizeFunction{}\empty@sfcnt\font@warning}
445 \DeclareSizeFunction{s}\empty@sfcnt\font@info}
446 \def\empty@sfcnt#1{%
447   \@tempdimb \f@size\p@
448   \ifx\optional@arg\empty
449   \else
450     \@tempdimb \optional@arg\@tempdimb
451     #1{Font\space shape\space '\curr@fontshape'\space
452       will\space be\MessageBreak
453       scaled\space to\space size\space \the\@tempdimb}%
454   \fi
455   \edef\external@font{\mandatory@arg\space at\the\@tempdimb}}

```

`\s@fct@gen` This size function generates the external name from the mandatory argument and the requested user size, and thus can be used for external names where the size is encoded in the font name. The optional argument a scale factor. The font is scaled to `\f@size` if no optional argument is present, and to `\f@size` multiplied by the optional argument otherwise.

```

456 \DeclareSizeFunction{gen}\gen@sfcnt\font@warning}
457 \DeclareSizeFunction{sgen}\gen@sfcnt\font@info}
458 \def\gen@sfcnt{%
459   \edef\mandatory@arg{\mandatory@arg\f@size}%
460   \empty@sfcnt}

```

`\s@fct@genb` This size function is similar to `gen`, but for fonts where the size is encoded in the font name in centipoints, as in the DC fonts version 1.2. The font is scaled to `\f@size` if no optional argument is present, and to `\f@size` multiplied by the optional argument otherwise.

```

461 \DeclareSizeFunction{genb}{\genb@sfcnt\@font@warning}
462 \DeclareSizeFunction{sgenb}{\genb@sfcnt\@font@info}

463 \def\genb@sfcnt{%
464     \edef\mandatory@arg{\mandatory@arg\expandafter\genb@x\f@size..\@}%
465     \empty@sfcnt}

\genb@x The auxiliary macros \genb@x and \genb@y are used to convert the \f@size into
\genb@y centipoints.

466 \def\genb@x#1.#2.#3\@@{\two@digits{#1}\genb@y#200\@@}
467 \def\genb@y#1#2#3\@@{#1#2}

\s@fct@sub This size function handles font substitution. The mandatory argument is a fam-
ily/series/shape combination, the optional argument (if present) is ignored. The
font encoding scheme cannot be changed. Therefore, the first thing we do is to
prepend the encoding scheme. documentation fixes

468 \DeclareSizeFunction{sub}{\sub@sfcnt\@font@warning}
469 \DeclareSizeFunction{ssub}{\sub@sfcnt\@font@info}

470 \def\sub@sfcnt#1{%
471     \edef\mandatory@arg{\f@encoding/\mandatory@arg}%

Next action is split the arg into its individual components and allow for a late font
shape load.

472     \begingroup
473     \expandafter\split@name\mandatory@arg/\@nil
474     \try@load@fontshape
475     \endgroup

Then we record the current \f@size since it may get clobbered.

476     \let\f@user@size\f@size

Then we check whether this new combination is defined and give an error message
if not. In this case we also switch to \error@fontshape.

477     \expandafter
478     \ifx\csname\mandatory@arg\endcsname\relax
479         \errmessage{No\space declaration\space for\space
480             shape\space \mandatory@arg}%
481         \error@fontshape
482     \else

Otherwise we warn the user about the substitution taking place.

483     #1{Font\space shape\space '\curr@fontshape'\space in\space
484         size\space <\f@size>\space not\space available\MessageBreak
485         Font\space shape\space '\mandatory@arg'\space tried\space
486         instead}%
487     \expandafter\split@name\mandatory@arg/\@nil
488     \fi

Then we restart the font specification scan by calling \get@external@font.

489     \edef\f@size{\f@user@size}%
490     \get@external@font

Finally \do@subst@correction is called to get the font name right.

491     \do@subst@correction
492 }

```

`\font@aliasinfo` Sometimes a substitution is only done to map a long font name to a standard shape or series, e.g.,

```
\DeclareFontShape{T1}{Roboto-LF}{b}{it}{<-> alias * Roboto-LF/bold/it}{}
```

Using the `ssub` function in that case will give a strange (and incorrect) warning. As an alternative we therefore offer the size function `alias`. It will still add some info into the `.log` file, but no longer complains that the font shape is not available. It is implemented by grabbing the default warning text and replacing it with a new one.

```
493 </2ekernel>
494 <*2ekernel | latexrelease>
495 <latexrelease> \IncludeInRelease{2020/02/01}%
496 <latexrelease> { \font@aliasinfo } { alias size function } %
497 \DeclareSizeFunction{alias}{ \sub@sfcnt \font@aliasinfo }
498 \def \font@aliasinfo #1 {%
499   \font@info {Font \space shape \space ' \curr@fontshape ' \space
500             aliased \space to \MessageBreak ' \mandatory@arg } %
501 }
502 </2ekernel | latexrelease>
503 <latexrelease> \EndIncludeInRelease
504 <latexrelease> \IncludeInRelease{0000/00/00}%
505 <latexrelease> { \font@aliasinfo } { alias size function } %
506 <latexrelease> \let \s@fct@alias \@undefined
507 <latexrelease> \let \font@aliasinfo \@undefined
508 <latexrelease>
509 <latexrelease> \EndIncludeInRelease
510 <*2ekernel>
```

`\s@fct@subf` The `subf` size function allows substitution of another font. The mandatory argument is the external name of the font to be substituted, the optional argument a size scaling factor like in the default size function. The main difference to the default size function is the warning message.

```
511 \DeclareSizeFunction{subf}{ \sub@sfcnt \font@warning }
512 \DeclareSizeFunction{ssubf}{ \sub@sfcnt \font@info }

513 \def \sub@sfcnt #1 {%
514   #1 {Font \space shape \space ' \curr@fontshape ' \space in \space
515       size \space \f@size \space not \space available \MessageBreak
516       external \space font \space ' \mandatory@arg ' \space used } %
517   \empty@sfcnt #1 %
518 }
```

`\s@fct@fixed` The `fixed` size function is for using a font at a different size than requested. A warning message is printed, and the external font to be used is taken from the mandatory argument. If an optional argument is present it is used as the ‘at’ size for the font. Otherwise the font is loaded at its design size.

```
519 \DeclareSizeFunction{fixed}{ \fixed@sfcnt \font@warning }
520 \DeclareSizeFunction{sfixed}{ \fixed@sfcnt \font@info }

521 \def \fixed@sfcnt #1 {%
522   \ifx \optional@arg \empty
523     \let \external@font \mandatory@arg
524   \else
```

```

525     \edef\external@font{\mandatory@arg\space at\optional@arg pt}%
526     \fi
527     #1{External\space font\space '\external@font'\space loaded\space
528         for\space size\MessageBreak
529         <\f@size>}%
530 }
531 </2ekernel>

```

File r

ltfsscmp.dtx

This file contains the implementation of commands giving compatibility with the original ‘NFSS1’ release of the Font Selection Scheme.

Warning: The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

Version 1 of NFSS is obsolete now for about 20 years (and was “current” only for a short intermediate time) so with the 2015 release these internal interface commands are removed from the kernel and made available via `latexrelease` package so that backward compatibility remains ensured for very old documents.

```

File s

ltfssdcl.dtx

This file contains the main implementation of the font selection scheme commands. See other parts of the L^AT_EX distribution, or *The L^AT_EX Companion* for higher level documentation of these commands.

Warning: The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

37 Interface Commands

`\in@` `\@in` is a utility macro with two arguments. It determines whether its first argument occurs in its second and sets the switch `\ifin@` accordingly. The first argument may not contain braces nor # (more precisely, tokens of category code 1, 2, or 6).

```

1 (*2kernel)
2 \def\in@#1#2%
3 {%

9   \ifx\in@@\@empty
10    \in@false
11  \else
12    \in@true
13  \fi
14 }
15 \newif\ifin@

```

Before the `\begin{document}` command several *math versions* and *math alphabet identifiers* may be declared. In principle, there should be exactly one family/series/shape combination be declared for each version/alphabet pair. But we want to allow for defaults as well for automagical filling of holes.

While building the tables for math alphabet identifiers and math versions we keep several lists:

- the list of all math versions, `\version@list`, each entry prefixed by the control sequence `\version@elt`, i.e. this list has the following form

$$\text{\version@elt}\langle version_1 \rangle \text{\version@elt}\langle version_2 \rangle \dots \text{\version@elt}\langle version_n \rangle$$

- the list of all math alphabet identifiers. Here every entry has the form:

$$\text{\group@elt}\langle math\ group\ number \rangle \{ \{ \langle default\ family \rangle \} \{ \langle default\ series \rangle \} \{ \langle default\ shape \rangle \} \}.$$

- Each defined math alphabet identifier holds a list containing Information about the *versions* for which it is defined. This list has a more complicated structure: it looks as follows:

```

\set@alpha<the alphabet identifier itself>
\reserved@c<math version><font info>
...
\@nil

```

where $\langle font\ info \rangle$ is either $\backslash reserved@e$ (if the combination is not defined yet) or

```
{\langle family \rangle}{\langle series \rangle}{\langle shape \rangle}
```

$\backslash version@list$ We initialize the version list to be empty.

```

16 \let\version@list=\@empty
17 \@onlypreamble\version@list

```

$\backslash version@elt$

```

18 \let\version@elt\relax
19 \@onlypreamble\version@elt

```

$\backslash new@mathversion$ The macro $\backslash new@mathversion$ is called with the version control sequence as its argument.

```
20 %\def\new@mathversion#1{%
```

The first thing this macro does is to check if the version identifier is already present in $\backslash version@list$. We enclose $\backslash version@list$ in braces since it might be empty (if no *version* is defined yet). But this means that we need a suitable number of $\backslash expandafter$ primitives.

```

21 % \expandafter\in@\expandafter#1\expandafter{\version@list}%
22 % \ifin@

```

If so it prints an error message. The $\backslash next$ macro is used to get rid of the four characters $\backslash mv@$ that would otherwise appear at the begin of the version name in the error message.

```

23 % \latexerror{Math version
24 % \expandafter\@gobblefour\string#1'
25 % already defined}\@eha

```

Otherwise we have a new version, and we can proceed with entering it into the tables. We add it to $\backslash version@list$. This is very easy: we define $\backslash version@elt$ (which is the delimiter in $\backslash version@list$) to protect itself and the following token from being expanded and simply redefine $\backslash version@list$.

```

26 % \else
27 % \global\expandafter\newcount\csname c@\expandafter
28 % \gobble\string#1\endcsname
29 % \global\csname c@\expandafter
30 % \gobble\string#1\endcsname\@ne
31 % \def\version@elt{\noexpand\version@elt\noexpand}%
32 % \edef\version@list{\version@list\version@elt#1}%

```

Then we prepare to enter the new version into all math alphabet identifier lists. Remember that these lists use `\reserved@c` as delimiter, and that there appears the control sequence `\reserved@e` that must not be expanded. Therefore we take suitable precautions.

```
33 %      \def\reserved@c{\noexpand\reserved@c\noexpand}%
34 %      \let\reserved@e\relax
```

We will now go through the `\alpha@list` to process every $\langle\textit{math alphabet identifier}\rangle$ in turn. Since this list has `\group@elt` as a delimiter we define this control sequence. It has three arguments as every entry consists of three items (as explained above).

```
35 %      \def\group@elt##1##2##3{%
```

The first of these arguments is the $\langle\textit{math alphabet identifier}\rangle$. We redefine it by appending the information about the new version at the end of the list contained in it. However, there is one subtlety: the definitions for `\reserved@c` and `\reserved@e` made above prevent the main part of the list from being expanded. But we still have to take care of the header and the trailer. To do this we remove the trailer by means of the macro `\remove@nil` which also protect the header from being expanded. Its definition is given below. Now we can prepare to add the new version.

```
36 %          \edef##1{\expandafter\remove@nil##1%
37 %              \reserved@c
38 %              #1%
39 %              \reserved@e
40 %              \noexpand\@nil}}%
```

Finally we call `\alpha@list` which will now execute the macro `\group@elt` once for every defined $\langle\textit{math alphabet identifier}\rangle$. And that's all for now.

```
41 %      \alpha@list
42 %      \fi}
```

`\alpha@list` As we explained above every entry in `\alpha@list` has the form
`\alpha@elt`
 $\langle\textit{alphabet identifier}\rangle\langle\textit{internal group number}\rangle\langle\textit{default font assignments}\rangle\dots$

We initialize it to `\@empty`.

```
43 \let\alpha@list\@empty
44 \@onlypreamble\alpha@list
```

`\alpha@elt`

```
45 \let\alpha@elt\relax
46 \@onlypreamble\alpha@elt
```

`\newgroup` Start the group (fam) allocation at 0. (Doesn't belong here.)

```
47 \count18=-1
```

`\stepcounter`

`\select@group` We surround `\select@group` with braces so that functions using it can be used directly after `_` or `^`. However, if we use oldstyle syntax where the math alphabet doesn't have arguments (ie if `\math@bgroup` is not `\bgroup`) we need to get rid of the extra group.

```

```

`\process@table`

```

200 \def\process@table{%
201   \def\cdp@elt##1##2##3##4{%
202     \@font@info{Checking defaults for
203       ##1/##2/##3/##4}%
204     \expandafter
205     \ifx\csgname##1/##2/##3/##4\endcsname\relax

```

Grouping is important for two reasons, first `\cdp@elt` will get redefined if `\Declare...` functions are executed within the external `.fd` file and secondly `\try@load@fontshape` changes a lot of catcodes without surrounding itself with a group.

```

206     \begingroup
207     \def\fontencoding{##1}\def\fontfamily{##2}%
208     \try@load@fontshape
209     \endgroup
210     \fi
211     \expandafter
212     \ifx\csgname##1/##2/##3/##4\endcsname\relax
213       \@latex@error{This NFSS system isn't set up properly}%
214       {For encoding scheme ##1 the defaults
215         ##2/##3/##4 do not form a valid font shape}%
216     \else
217       \@font@info{... okay}%
218     \fi}%
219   \cdp@list

```

Now we make sure that `\error@fontshape` is okay.

```

220   \begingroup
221   \escapechar\m@ne
222   \error@fontshape
223   \expandafter\ifx\csgname \curr@fontshape\endcsname\relax

755   \fi
756   #1}
757 \onlypreamble\DeclareMathDelimiter

```

`\@xxDeclareMathDelimiter` This macro checks if the second arg is a “math type” such as `\mathopen`. The undocumented original code didn’t use math types when the delimiter was a single letter. For this reason the coding is a bit strange as it tries to support the undocumented syntax for compatibility reasons.

```

758 \def\@xxDeclareMathDelimiter#1#2#3#4{%

```

7 is the default value returned in the case that `\mathchar@type` is passed something unexpected, like a math symbol font name. We locally move `\mathalpha` out of the way so if you use that the right branch is taken. This will still fail if an explicit number 7 is used!

```

759   \begingroup
760   \let\mathalpha\mathord
761   \ifnum7=\mathchar@type{#2}%
762     \endgroup

```

If this branch is taken we have old syntax (5 arguments).

```

763     \expandafter\@firstofone
764   \else

```

If this branch is taken `\mathchar@type` is different from 7 so we assume new syntax. In this case we also use the arguments to set up the letter as a math symbol for the case where it is not used as a delimiter.

```

765     \endgroup
766     \DeclareMathSymbol#1{#2}{#3}{#4}%

```

Then we arrange that `\@xDeclareMathDelimiter` only gets #1, #3, #4 ... as it does not expect a math type as argument.

955     \fi
956   \fi}
957 \fi}
958 \@onlypreamble\mathchar@type

```

`\DeclareSymbolFontAlphabet`

```

959 \def\DeclareSymbolFontAlphabet#1#2{%
960   \expandafter\DeclareSymbolFontAlphabet@
961     \csname \expandafter\@gobble\string#1\space\endcsname{#2}#1}
962 \@onlypreamble\DeclareSymbolFontAlphabet

```

`\DeclareSymbolFontAlphabet@`

```

963 \def\DeclareSymbolFontAlphabet@#1#2#3{%
  We use the switch \if@tempswa to decide if we can declare this symbol font
  alphabet.
964   \@tempwattrue

```

First check if #2 is known to be a symbol font

```

965 \expandafter\in@\csname sym#2\expandafter\endcsname
966 \expandafter{\group@list}%
967 \ifin@

```

Check if #1 is defined as a math alphabet defined via `\DeclareMathAlphabet`:

```

968 \expandafter\in@\expandafter#1\expandafter{\alpha@list}%
969 \ifin@

```

If so remove it from the `\alpha@list` and from all math version macros.

```

970 \@font@info{Redeclaring math alphabet \string#3}%
971 \toks@{}%
972 \def\alpha@elt##1##2##3{%
973 \ifx##1#1\else\addto@hook\toks@{\alpha@elt##1##2##3}\fi}%
974 \alpha@list
975 \xdef\alpha@list{\the\toks@}%

```

Now we loop over all versions and remove the math alphabet:

```

976 \def\version@elt##1{%
977 \begingroup
978 \toks@{}%
979 \def\getanddefine@fonts####1####2{%
980 \addto@hook\toks@{\getanddefine@fonts####1####2}}%
981 \def\install@mathalphabet####1####2{%
982 \ifx####1#1\else
983 \addto@hook\toks@{\install@mathalphabet
984 #####1{####2}}\fi}%
985 ##1%
986 \xdef##1{\the\toks@}%
987 \endgroup
988 }%
989 \version@list
990 \else

```

If #3 is not defined as a math alphabet check if it is defined at all:

```

991 \expandafter\ifx
992 \csname\expandafter\@gobble\string#1\space\endcsname
993 \relax

```

If it is undefined, fine otherwise check if it is a math alphabet defined via `\DeclareSymbolFontAlphabet`:

```

994 \else
995 \edef\reserved@a{%
996 \noexpand\in@{\string\use@mathgroup}{\meaning#1}}%
997 \reserved@a
998 \ifin@
999 \@font@info{Redeclaring math alphabet \string#3}%
1000 \else

```

Since the command #3 is defined to be something which is not a math alphabet we have to skip redefining it.

```

1001 \@tempswafalse
1002 \@latex@error{Command ‘\string#3’ already defined}\@eha
1003 \fi
1004 \fi
1005 \fi
1006 \else

```

Since the symbol font is not known we better skip defining this alphabet.

```

1007     \@tempswafalse
1008     \@latex@error{Unknown symbol font '#2'}\@eha
1009     \fi
1010     \if@tempswa

```

When we reach this point we are allowed to define #1 to be a symbol font math alphabet. This means that we have to set it to

```
\use@mathgroup <math-settings> \sym<name>
```

The $\langle math\text{-}settings \rangle$ are the one for the encoding that is used in the font shape where $\backslash\mathrm{sym}\langle name \rangle$ is pointing to. This means that we have to get it from the information stored in $\backslash\mathrm{group@list}$. Thus we loop through that list after defining $\backslash\mathrm{group@elt}$ in a suitable way.

```

1011     \def\group@elt##1##2{%
1012         \expandafter\ifx\csname sym#2\endcsname##1%
1013         \expandafter\reserved@a\string##2\@nil
1014         \fi}%
1015     \def\reserved@a##1##2/##3\@nil{%
1016         \def\reserved@a{##2}}%
1017     \group@list
1018     \toks@{\relax\ifmmode \else \non@alpherr#1\fi}%

```

File t

ltfssini.dtx

This file contains the top level L^AT_EX interface to the font selection scheme commands. See other parts of the L^AT_EX distribution, or *The L^AT_EX Companion* for higher level documentation of these commands.

38 NFSS Initialisation

Finally, there are six commands that are to be used in L^AT_EX and that we will therefore protect against expansion at the wrong point: `\fontfamily`, `\fontseries`, `\fontshape`, `\fontsize`, `\selectfont`, and `\mathversion`.

```
1 \<2kernel>
```

38.1 Providing math *versions*

L^AT_EX provides two *versions*. We call them *normal* and *bold*, respectively.

```
2 \DeclareMathVersion{normal}
3 \DeclareMathVersion{bold}
```

Now we define the standard font change commands. We don't allow the use of `\rmfamily` etc. in math mode.

(Actually most are now defined further down in the file.)

First the changes to another *family*:

```
4 %\DeclareRobustCommand\rmfamily
5 %      {\not@math@alphabet\rmfamily\mathrm}
6 %      \fontfamily\rmdefault\selectfont}
7 %\DeclareRobustCommand\sffamily
8 %      {\not@math@alphabet\sffamily\mathsf}
9 %      \fontfamily\sfdefault\selectfont}
10 %\DeclareRobustCommand\ttfamily
11 %      {\not@math@alphabet\ttfamily\mathtt}
12 %      \fontfamily\ttdefault\selectfont}
```

Then the commands changing the *series*:

```
13 %\DeclareRobustCommand\bfseries
14 %      {\not@math@alphabet\bfseries\mathbf}
15 %      \fontseries\bfdefault\selectfont}
16 %\DeclareRobustCommand\mdseries
17 %      {\not@math@alphabet\mdseries\relax}
18 %      \fontseries\mddefault\selectfont}
19 \DeclareRobustCommand\upshape
20      {\not@math@alphabet\upshape\relax}
21      \fontshape\updefault\selectfont}
```

Then the commands changing the *shape*:

```
22 \DeclareRobustCommand\slshape
23      {\not@math@alphabet\slshape\relax}
24      \fontshape\sldefault\selectfont}
25 \DeclareRobustCommand\scshape
26      {\not@math@alphabet\scshape\relax}
```

```

27         \fontshape\scdefault\selectfont}
28 \DeclareRobustCommand\itshape
29     {\not@math@alphabet\itshape\mathit
30     \fontshape\itdefault\selectfont}

```

39 Custom series settings for main document families

This section was introduced 2020/02/02 and for now we support a full rollback (may need splitting later).

```

31 \endkernel
32 \if*2ekernel|latexrelease
33 (latexrelease)\IncludeInRelease{2020/02/02}%
34 (latexrelease)          {\DeclareFontSeriesDefault}{Custom series}%

```

One problem with the NFSS approach of handling the series axis turned out to be that (especially with respect to “boldness”) different font families implemented different strategies. For example, with Computer Modern fonts you normally only have **bx** whereas most PostScript fonts offered only **b** but not **bx**. As a result L^AT_EX’s standard setting for `\bfdefault` didn’t work with such fonts, but if it got changed to produce **b**, then that didn’t work with Computer Modern if the fonts got combined (e.g., using Computer Modern Typewriter with such fonts).

The solution back then was to provide substitution rules in the font `.fd` such that if a **bx** series got requested the **b** series got used. While this works in that particular case, it isn’t a very general solution. For example, if you happen to have a font family that has several weights you may want to typeset the whole document in a somewhat lighter or darker font but if you then modify `\mddefault` to allow for this, then of course your change only works with that particular family but not with the typewriter or sans serif family you also want to use.

A better solution was provided by the `mweights` package by Bob Tennent that offers defaults on the level of the three main font families in the document: for “rm”, “sf” and “tt” so that font packages could define defaults for the sans serif document font by providing `\bfseries@sf` which then was used when `\bfseries` got executed and the current family was the `\sffamily`.

`\DeclareFontSeriesDefault`

We now support this concept directly from within L^AT_EX and for use in font packages (or the document preamble) we offer `\DeclareSeriesDefault`. This declaration takes three arguments:

document family interface: Can either be `rm`, `sf` or `tt`. This is optional and if not given the overall default.

document series interface: Can be `md` or `bf`.

series value: This is the value that is going to be used with the combination is requested.

For example, `\DeclareFontSeriesDefault[rm]{bf}{sb}` would use **sb** (semi-bold) when `\rmfamily \bfseries` is asked for.

If used without the optional argument, e.g., `\DeclareFontSeriesDefault{bf}{b}` then this is like redefining `\bfdefault` or `\mddefault`.

If some family specific defaults aren't given, e.g. if there are no declarations for, say, `tt` then the format defaults of `\mddefault` and `\bfdefault` are assumed. If those are later changed this is *not* reflected!⁷

`\DeclareFontSeriesDefault` The command to declare font series defaults for the “rm”, “sf” or “tt” family.

```

35 \newcommand\DeclareFontSeriesDefault[3][]{%
36   \def\reserved@a{#1}%
No optional argument: set up general default.
37   \ifx\reserved@a\@empty
38     \ifcsname #2series\endcsname           % supported are
39                                           % \[md/bf]default
40     \expandafter\def
41       \csname #2default\endcsname{#3}%
42   \else
43     \@latex@error{Wrong syntax for \string\DeclareFontSeriesDefault}%
44     {Mandatory first argument must be 'md' or 'bf'.}
45   \fi

```

Optional argument given, set up specific default.

```

46   \else
47     \ifcsname #2series@#1\endcsname       % supported are
48                                           % \[md/bf]series@[rm/sf/tt]
49     \expandafter\edef
50       \csname #2series@#1\endcsname{#3}%

```

If the interface is used we remove the frozen kernel default. This way, we know that something was explicitly set up (even if the setup has the same value as the default).

```

51     \expandafter\let
52       \csname #2series@#1@kernel\endcsname\@undefined
53   \else
54     \@latex@error{Wrong syntax for \string\DeclareFontSeriesDefault}%
55     {Optional argument must be 'rm', 'sf', or 'tt'. \MessageBreak
56       Mandatory first argument must be 'md' or 'bf'.}
57   \fi
58 \fi
59 }

```

`\mdseries@rm` We initialize the family specific default at the end of the format generation. Later on they may get overwritten in the preamble or a package via `\DeclareFontSeriesDefault` (or possibly directly).

`\mdseries@sf` Conceptual change: The `\bfdefault` will be `b` not `bx` because that is what it should be really for nearly every font except Computer/Latin Modern.

`\mdseries@tt` To account for the fact that by default we typeset in CM or LM we set up the `\bfseries@..` defaults to use `bx` instead.

This means that it behaves like before because if the default fonts are used then `\bfseries@rm` etc kick in and make `\textbf` use `bx`. However, if the font gets changed then `\bfdefault` will get used.

⁷I see no easy way to achieve this without compromising compatibility with existing packages that currently use `mweights` and directly define (some) of the `\mdseries@..` commands but not others.

```

60 \def\bfseries@rm{bx}
61 \def\bfseries@sf{bx}
62 \def\bfseries@tt{bx}

```

Frozen version of the kernel defaults so we can see if they have changed.

```

63 \let\bfseries@rm@kernel\bfseries@rm
64 \let\bfseries@sf@kernel\bfseries@sf
65 \let\bfseries@tt@kernel\bfseries@tt

```

The default for the medium series is `m` and this will be interpreted as resetting both weight and width. To reset only one of them the virtual value `?m` and `m?` are available.

```

66 \def\mdseries@rm{m}
67 \def\mdseries@sf{m}
68 \def\mdseries@tt{m}

```

`\expand@font@defaults` The family specific defaults are fully expanded, i.e., they are defined via `\edef` inside `\DeclareFontSeriesDefault`. However, the overall defaults, e.g., `\bfdefault` may have been redefined by the user and thus may not be fully expanded. So to enable reliable comparison we make expanded versions of them. That we rerun each time. The alternative would be to only allow for changes before begin document.

```

69 \def\expand@font@defaults{%
70   \edef\rmdef@ult{\rmdefault}%
71   \edef\sdef@ult{\sfdefault}%
72   \edef\ttdef@ult{\ttdefault}%
73   \edef\bfdef@ult{\bfdefault}%
74   \edef\mddef@ult{\mddefault}%
75   \edef\famdef@ult{\familydefault}%
76 }

```

`\bfseries` This document command switches to the bold series.

```

77 \DeclareRobustCommand\bfseries{%
78   \not@math@alphabet\bfseries\mathbf

```

In the original NFSS definition it then called `\fontseries` with the value `\bfdefault`. In the new scheme we have more alternatives and therefore check if the current family (`\f@family`) is the current `\rmdef@ult`, `\sdef@ult` or `\ttdef@ult` and then select the correct family default in that case.

```

79   \expand@font@defaults
80   \fontseries{%
81     \ifx\f@family\rmdef@ult      \bfseries@rm
82     \else\ifx\f@family\sdef@ult  \bfseries@sf
83     \else\ifx\f@family\ttdef@ult \bfseries@tt

```

If not `\bfdefault` is used.

```

84     \else                        \bfdefault
85     \fi\fi\fi
86   }%
87   \selectfont
88 }

```

`\mdseries` This document command switches to the medium series.

```

89 \DeclareRobustCommand\mdseries{%

```

```

90 \not@math@alphabet\mdseries\relax
91 \expand@font@defaults
92 \fontseries{%
93   \ifx\f@family\rmdef@ult      \mdseries@rm
94   \else\ifx\f@family\sfdef@ult \mdseries@sf
95   \else\ifx\f@family\ttdef@ult \mdseries@tt
96   \else                        \mddefault
97   \fi\fi\fi
98 }%
99 \selectfont
100 }

```

`\rmfamily` Here are the document level commands for changing the main font families, or rather, here is a documented outline of the code, the actual code is then streamlined and somewhat generalized.

```

\DeclareRobustCommand\rmfamily{%
  \not@math@alphabet\rmfamily\mathrm

```

If families are changed then we have to do a bit more work. In the original NFSS implementation a family change kept encoding, series shape and size unchanged but now we can't any longer simply reuse the current series value. Instead we may have to change it from one family default to the next.

```

\expand@font@defaults

```

We have to do the testing while the current family is still unchanged but we have to do the adjustment of the series after it got changed (because the new family might has different sets of shapes available and we certainly don't want to see substitution going on. So we use `\target@series@value` to hold the target series (if any).

```

\let\target@series@value\@empty

```

Thus, if the current family is the sans family

```

\ifx\f@family\sfdef@ult

```

and if we using the medium series of the sans family

```

\ifx\f@series\mdseries@sf

```

then lets switch to the medium series for the serif family

```

\let\target@series@value\mdseries@rm

```

and if we use the bold series of the sans family switch to the bold default of the serif family:

```

\else\ifx\f@series\bfseries@sf \let\target@series@value\bfseries@rm

```

However, the sans family may not have any specific defaults set, so we also compare with the overall defaults.

```

\else\ifx\f@series\mdef@ult \let\target@series@value\mdseries@rm
\else\ifx\f@series\bfdef@ult \let\target@series@value\bfseries@rm

```

If neither test was true we leave the series alone. This way a special manual setting such as `\fontseries{lc}` is not undone if the family changes (of course there may not be any support for it in the new family but then the NFSS substitution kicks in and sorts it out).

```
\fi\fi\fi\fi
```

We need to do the same if the current family is the typewriter family:

```
\else\ifx\f@family\ttdef@ult
  \ifx\f@series\mdseries@tt      \let\target@series@value\mdseries@rm
  \else\ifx\f@series\bfseries@tt \let\target@series@value\bfseries@rm
  \else\ifx\f@series\mddef@ult    \let\target@series@value\mdseries@rm
  \else\ifx\f@series\bfdef@ult    \let\target@series@value\bfseries@rm
  \fi\fi\fi\fi
\fi\fi
```

With these preparations for series out of the way we can now change the font family to `\rmdefault`.

```
\fontfamily\rmdefault
```

If `\target@series@value` is still empty there is nothing more to do other than selecting the new family. However, if not then we should update the font series now as well. But there is one further subtle issue. We may not have loaded an `.fd` file for our target font family yet. In the past that was done in `\selectfont` if necessary but since we are now doing all the comparisons in `\fontseries` we need to make sure that the font family specifications are already loaded prior to calling `\fontseries`.

```
\ifx\target@series@value\@empty \else
  \maybe@load@fontshape
```

Updating the series in this case means directly changing `\f@series` to the target value. We don't want to go through `\fontseries` because that would apply the mappings and then `bx + b` would keep `bx` instead of changing to `b` as desired. as

```
\let\f@series\target@series@value
\fi
\selectfont}
```

So now for the real definition: most of the code above gets delegated to a helper command `\prepare@family@series@update` so that the definition becomes again fairly short. In addition we add a hook, mainly for our Japanese friends so that the code can be extended prior to the call to `\selectfont`.

```
101 \DeclareRobustCommand\rmfamily{%
102   \not@math@alphabet\rmfamily\mathrm
```

This holds all the code discussed above, first argument is the meta family, i.e., `rm` in this case, and second argument is the default family name, e.g., `cmr` indirectly accessed via `\rmdefault`. This is calling `\fontfamily` and if necessary `\fontseries` as outline above.

```
103   \prepare@family@series@update{rm}\rmdefault
```

Then comes the hook code (by default a no-op) and finally the call to `\selectfont`.

```
104 \rmfamilyhook
105 \selectfont}
```

`\sffamily` The definitions for `\sffamily` and `\ttfamily` are similar, the differences are only
`\ttfamily` in what font families get checked.

```
106 \DeclareRobustCommand\sffamily{%
107 \not@math@alphabet\sffamily\mathsf
108 \prepare@family@series@update{sf}\sfdefault
109 \@sffamilyhook
110 \selectfont}

111 \DeclareRobustCommand\ttfamily{%
112 \not@math@alphabet\ttfamily\mathtt
113 \prepare@family@series@update{tt}\ttdefault
114 \@ttfamilyhook
115 \selectfont}
```

`\rmfamilyhook` By default the hooks do nothing.

`\@sffamilyhook` 116 `\let\rmfamilyhook\@empty`

`\@ttfamilyhook` 117 `\let\@sffamilyhook\@empty`

118 `\let\@ttfamilyhook\@empty`

`\prepare@family@series@update` This is core command that prepares for the family update. The big difference to the documented code above is that the nested `\ifx` statements seem to be missing. Instead we loop through an internal list that holds the names of the three meta families. This approach allows us to extend the mechanism at a later stage to allow for additional named meta families.

`\@meta@family@list` Here is the current definition of that list:

```
119 \def\@meta@family@list{\@elt{rm}\@elt{sf}\@elt{tt}}

120 \def\prepare@family@series@update#1#2{%
121 \expand@font@defaults
```

We prepare for changing the current series. We have to find it before changing the family as discussed above.

```
122 \let\target@series@value\@empty
123 \def\target@meta@family@value{#1}%
```

To find it we loop over the meta family list with a suitable definition of `\@elt`.

```
124 \let\@elt@update@series@target@value
125 \@meta@family@list
126 \let\@elt\relax
```

That will figure out the correct series value to use without updating it. Now we can change the family.

```
127 \fontfamily#2%
```

After that we update the series. That code is again like the one above.

```
128 \ifx\target@series@value\@empty
129 \else
130 \maybe@load@fontshape
131 \let\f@series\target@series@value
132 \fi
133 }
```

`\update@series@target@value` In this macro used in the look you basically find the nested `\ifxs` from the outline above. The only difference is that it is parameterized instead of being written out and only for one block of tests because the code is called repeatedly when looping over the meta family list. From the list we get each meta family name in turn.

```

134 \def\update@series@target@value#1{%
    There is one additional test at the beginning, because the list contains all meta
    families and we need to ignore the case where current one from the list and target
    one are identical.
    135 \def\reserved@a{#1}%
    136 \ifx\target@meta@family@value\reserved@a % rm -> rm do nothing
    137 \else
    We only “do” something if the current font family matches the current meta family.
    138 \expandafter\ifx\csname#1def@ult\endcsname\fontfamily
    If that’s the case we know that this is the block that applies (only one meta family
    can match). So to speed things up we change \@elt so that the rest of the loop
    gets gobbled.
    139 \let\@elt\@gobble
    Then we try to find the right new value for the series (as explained above). The
    two macros defined first are only there because we now need to use \csname and
    this way the code will be a little faster.
    140 \expandafter\let\expandafter\reserved@b
    141 \csname mdseries@\target@meta@family@value\endcsname
    142 \expandafter\let\expandafter\reserved@c
    143 \csname bfseries@\target@meta@family@value\endcsname
    This here is now identical to the nested \ifx block from the outline, except that it
    there appeared twice in \rmfamily. This is now covered by looping and stopping
    the loop when a match was found.
    144 \expandafter\ifx\csname mdseries@#1\endcsname\fontseries
    145 \let\target@series@value\reserved@b
    146 \else\expandafter\ifx\csname bfseries@#1\endcsname\fontseries
    147 \let\target@series@value\reserved@c
    148 \else\ifx\fontseries\mddef@ult \let\target@series@value\reserved@b
    149 \else\ifx\fontseries\bfdef@ult \let\target@series@value\reserved@c
    150 \fi\fi\fi\fi
    151 \fi
    152 \fi
    153 }

```

`\init@series@setup` This is code to be run at begin document ...

```

154 \def\init@series@setup{%

```

We only want `bx` in `\bfseries@rm` if the roman font is Computer Modern or Latin Modern, otherwise it should be `b`. It was set to `bx` in the kernel so that any font use with the default families in the preamble get this value. Now at the real document start we check if the fonts have been changed. If there was a `\DeclareFontSeriesDefault` declaration or `\bfseries@rm` was directly altered then it differs from `\bfseries@rm@kernel` and we do nothing. Otherwise we check if `\rmdefault` is one of the CM/LM font families and if so we keep `bx` otherwise we change it to `b`.

This approach doesn't cover one case: CM/LM got changed to a different family that supports `bx`, but the support package for that family used `\def\bfseries@rm{bx}` instead of using `\DeclareFontSeriesDefault`. In that case the code here changes it to `b`. Solution: use the `\DeclareFontSeriesDefault` interface.

```
155 \ifx\bfseries@rm@kernel\bfseries@rm
156   \expandafter\in@\expandafter{\rmdefault}{cmr,cmss,cmtt,lcms,lcmtt,lmr,lmss,lmtt}%
157   \ifin@ \else \def\bfseries@rm{b}\fi\fi
```

Same approach for `\bfseries@sf` and `\bfseries@tt`:

```
158 \ifx\bfseries@sf@kernel\bfseries@sf
159   \expandafter\in@\expandafter{\sfdefault}{cmr,cmss,cmtt,lcms,lcmtt,lmr,lmss,lmtt}%
160   \ifin@ \else \def\bfseries@sf{b}\fi\fi
161 \ifx\bfseries@tt@kernel\bfseries@tt
162   \expandafter\in@\expandafter{\ttdefault}{cmr,cmss,cmtt,lcms,lcmtt,lmr,lmss,lmtt}%
163   \ifin@ \else \def\bfseries@tt{b}\fi\fi
```

If the document preamble has changed the `\familydefault` or if the if the `\rmdefault` contains a new font family, we have to adjust the series defaults accordingly, before starting typesetting.

On the other hand if we still typeset in CM or LM then `\bfdefault` is wrong since it is now saying `b` and not `bx`.

To fix this we run `\rmfamily`, `\sffamily` or `\ttfamily` depending on the situation and this will correct the setup for us.

```
164 \expand@font@defaults
165 \ifx\famdef@ult\rmdef@ult \rmfamily
166 \else\ifx\famdef@ult\sfdef@ult \sffamily
167 \else\ifx\famdef@ult\ttdef@ult \ttfamily
168 \fi\fi\fi
169 }%
```

As the kernel code now implements the same functionality as `mweights`, albeit internally coded slightly differently, that package shouldn't be loaded any more. We therefore pretend that it already got loaded. Thus, a font package that tries to load it and then sets `\mdseries@...`, etc. will continue to work but will now use the kernel code.

Of course, mid-term such package should probably use `\DeclareFontSeriesDefault` instead of making using low-level definitions.

```
170 \expandafter\let\csname ver@mweights.sty\endcsname\fmtversion
171 </2kernel | latexrelease>
172 <latexrelease>\EndIncludeInRelease

```

This is always called in `\document` so don't make it undefined.

40 Supporting nested emphasis

By default $\text{\LaTeX} 2_{\epsilon}$ supports two levels of nested emphasis: if the current font has an upright shape then it switches to `\itshape` otherwise to `\emminnershape` (which defaults to `\upshape`). This means nested emphasis will oscillate between italic and upright shapes.

Sometimes it would be nice to allow for a more lengthy sequence, but instead of providing a fixed one \LaTeX now offers a general mechanism that allows to define arbitrary sequences.

`\DeclareEmphSequence`
`\emforce`

This declaration expects a comma separated list of (font) change declarations corresponding to increasing levels of emphasis. The mechanism tries to be “smart” and verifies that the declarations actually alter the font. If not it will ignore this level and tries the next one—the assumption being that there was a manual font change in the document to the font that is now supposed to be used for emphasis. Of course, this only works if the declarations in the list actually change the font

and not, say, just the color. In such a case one has to use `\emforce` to which directs the mechanism to use the level even if the font attributes haven't changed.

`\emreset` If the nesting is so deep, that the specified levels are exhausted then `\emreset` is used as a final set of declarations (which by default returns back to the upright shape). Any additional nesting levels will then reuse the list from its beginning.

`\DeclareEmphSequence` `\DeclareEmphSequence` expects a list of declaration. Spaces in the argument are dropped to avoid surious spaces in the output. The declarations are additive. At the very end the shape is reset using `\emreset` and `\emforce` so that this case is never skipped.⁸ Further nested calls restart at the beginning.

```

216 \endkernel
217 (*2ekernel | latexrelease)
218 (latexrelease)\IncludeInRelease{2020/02/02}%
219 (latexrelease)          {\DeclareEmphSequence}{Nested emph}%
220 \def\DeclareEmphSequence#1{%
221   \protected@edef\emfontdeclare@clist{\zap@space#1, \@empty\emforce\emreset}%
222 }
```

By default the it is empty, in which case `\emminnershape` is used by L^AT_EX.

```
223 \let\emfontdeclare@clist\@empty
```

`\emrest` Reset the font to upright and upper/lower case. With the default rules using `\shapedefault` does that for us but to be on the safe side we do it like this:

```
224 \DeclareRobustCommand\emreset{\upshape\ulcshape}
```

`\em` The new definition for `\em` (and implicitly `\emph` is like it was before if `\emfontdeclare@clist` is empty.

```

225 \DeclareRobustCommand\em{%
226   \@nomath\em
227   \ifx\emfontdeclare@clist\@empty
228     \ifdim \fontdimen\@ne\font >\z@
229       \emminnershape \else \itshape \fi
230   \else
```

But if not we use the list to decide how to do emphasis.

We use the current font to check if the declarations have any effect, so even a size change is allowed and identified as a modification (but a color change, for example, isn't). So first we save the current status.

```
231 \edef\em@currfont{\csname\curr@fontshape/\f@size\endcsname}%
```

Then we grab the next element from the list and check if it can be used.

```

232 \expandafter\do@emfont@update\emfontdeclare@clist\do@emfont@update
233 \fi
234 }
235 \def\emminnershape{\upshape}
```

`\do@emfont@update` We know that the list (if not empty) has at least 2 elements separated by a comma, so we pick up the first in #1 and the rest in #2.

```
236 \def\do@emfont@update#1,#2\do@emfont@update{%
```

⁸Maybe we should not add `\emforce` but allow that case to be skipped as well. Of course, that might result in an endless loop if somebody defines a sequence without any font change and without `\emforce` but ...

```

267 \latexrelease)      {\@nomath\em \ifdim \fontdimen\@ne\font >\z@
268 \latexrelease)      \upshape \else \itshape \fi}%
269 \latexrelease)\let\eminnershape\@undefined
270 \latexrelease)\EndIncludeInRelease
271 (*2kernel)

```

`\not@math@alphabet` This function generates an error message when it is called in math mode. The same function should be defined in `newfont.sty`.

```

272 \def\not@math@alphabet#1#2{%
273   \relax
274   \ifmmode
275     \@latex@error{Command \noexpand#1invalid in math mode}%
276     {%
277       Please
278       \ifx#2\relax
279         define a new math alphabet^^J%
280         if you want to use a special font in math mode%
281       \else

```

We have to a `\noexpand` below to prevent expansion of `#2`. In case of `#1` we can omit this (due to the current definition of robust commands since they do come out right there :-).

```

282         use the math alphabet \noexpand#2instead of
283         the #1command%
284       \fi
285       .
286     }%
287   \fi}

```

Finally we provide two abbreviations to switch to the *L^AT_EX* versions.

```

288 \DeclareRobustCommand\boldmath{\@nomath\boldmath
289   \mathversion{bold}}
290 \DeclareRobustCommand\unboldmath{\@nomath\unboldmath
291   \mathversion{normal}}

```

Here we switch to the default math version by defining the internal macro `\math@version`. We dare not to call `\mathversion` at this place because this would call `\glb@settings`.

```

292 \def\math@version{normal}

```

40.1 Miscellaneous

`\newfont` We start by defining a few macros that are part of standard *L^AT_EX*'s user interface.
`\symbol` The use of these functions is not encouraged, but they will allow to process older documents without changes to the source.

```

293 \def\newfont#1#2{\@ifdefinable#1{\font#1=#2\relax}}
294 \DeclareRobustCommand\symbol[1]{\char #1\relax}

```

`\@setfontsize` This abbreviation is used by *L^AT_EX*'s user level size changing commands, such as
`\@setsize` `\large`.

```

295 \def\@setfontsize#1#2#3{\@nomath#1%

```

For the benefit of people relying on keeping the name of the current font command saved in `\@currsiz` we define it. To ensure that `\@setfontsize` keeps being robust we omit this assignment during times where `\protect` differs from `\@typeset@protect`.

```
296 \ifx\protect\@typeset@protect
297 \let\@currsiz#1%
298 \fi
299 \fontsize{#2}{#3}\selectfont}
```

For compatibility we also define `\@setsize` the 209 command

```
300 \*compat
301 \def\@setsize#1#2#3#4{\@setfontsize#1{#4}{#2}}
302 \end{compat}
```

`\hexnumber@` To set up L^AT_EX's special math character definitions we first provide a macro to generate hexadecimal numbers. It is a rather simple `\ifcase`.

```
303 \def\hexnumber@#1{\ifcase\number#1
304 0\or 1\or 2\or 3\or 4\or 5\or 6\or 7\or 8\or
305 9\or A\or B\or C\or D\or E\or F\fi}
```

`\nfss@text` In its simplest form `\nfss@text` is an `\mbox`. This will produce unbreakable text outside math and inside math you will get text with the same fonts as outside. The only drawback is that such item won't change sizes in subscripts. But this behavior can be easily changed. With the `amstex` style option one will get a sub style called `amstext` which will redefine the `\nfss@text` macro to produce correct text in all sizes.

We have to use `\def` instead of the shorter `\let` since `\mbox` is undefined when we reach this point.

```
306 \def\nfss@text#1{\mbox{#1}}
```

`\copyright` The definition of `\copyright` was changed so that it works in other type styles, and to make it robust. We leave the family untouched so that the copyright notice will come out differently if a different font family is in use. This command is commented out, since it is now defined in `ltoutenc.dtx`.

```
307 %\DeclareRobustCommand\copyright
308 % \{\oalign{\hfil
309 % \raise.07ex\hbox{\mdseries\upshape c}\hfil\cr
310 % \mathhexbox20D}}}
```

`\normalfont` The macro `\reset@font` is used in L^AT_EX to switch to a standard font, in order to initialize the current font in situations where typesetting is done in a new visual context (e.g. in a footnote). We define it here to allow the test for the new L^AT_EX version above but nevertheless are able to run all kind of mixtures.

The user interface name for `\reset@font` is `\normalfont`:

```
311 \end{kernel}
312 \*2kernel | latexrelease
313 \ifx\latexrelease\IncludeInRelease{2020/02/02}%
314 \ifx\latexrelease\ifx\normalfont\Add hook to \normalfont}%
315 \DeclareRobustCommand\normalfont{%
```

Instead of calling `\usefont`, as it was done in the past, we inline the code from `\usefont` as we want to add the hook before `\selectfont`, but after all the font attributes are set.

```

316 \fontencoding\encodingdefault
317 \edef\f@family{\familydefault}%
318 \edef\f@series{\seriesdefault}%
319 \edef\f@shape{\shapedefault}%

320 \@defaultfamilyhook
321 \selectfont}

322 \let\reset@font\normalfont

```

`\@defaultfamilyhook` By default the hooks do nothing.

```

323 \let\@defaultfamilyhook\@empty

324 </2ekernel | latexrelease>
325 <latexrelease>\EndIncludeInRelease
326 <latexrelease>\IncludeInRelease{0000/00/00}%
327 <latexrelease> \normalfont}{Add hook to \normalfont}%
328 <latexrelease>
329 <latexrelease>\DeclareRobustCommand\normalfont
330 <latexrelease> \usefont\encodingdefault
331 <latexrelease> \familydefault
332 <latexrelease> \seriesdefault
333 <latexrelease> \shapedefault
334 <latexrelease> \relax}
335 <latexrelease>\let\reset@font\normalfont
336 <latexrelease>
337 <latexrelease>\let\@defaultfamilyhook\@undefined
338 <latexrelease>
339 <latexrelease>\EndIncludeInRelease
340 <*2ekernel>

```

We left out the special L^AT_EX fonts which are not automatically included in the base version of the font selection since these fonts contain only a few characters which are also included in the AMS fonts so anybody who is using these fonts doesn't need them. But for compatibility reasons we will define these symbols.

```

341 \def\not@base#1{\@latex@error
342 {Command \noexpand#1not provided in base LaTeX2e}%
343 {Load the latexsym or the amsfonts package to
344 define this symbol}}
345 \def\mho{\not@base\mho}
346 \def\Join{\not@base\Join}
347 \def\Box{\not@base\Box}
348 \def\Diamond{\not@base\Diamond}
349 \def\leadsto{\not@base\leadsto}
350 \def\squsubset{\not@base\squsubset}
351 \def\sqsupset{\not@base\sqsupset}
352 \def\lhd{\not@base\lhd}
353 \def\unlhd{\not@base\unlhd}
354 \def\rhd{\not@base\rhd}
355 \def\unrhd{\not@base\unrhd}

```

We now initialize all variables set by `\DeclareErrorFont`. These values are not really important since they will be overwritten later on by the definition in `fontdef.ltx`.

However, if `fontdef.cfg` is corrupted then at least a hopefully suitable error font is present.

```
356 \DeclareErrorFont{OT1}{cmr}{m}{n}{10}  %% don't modify this setting
357                                         %% overwrite it in fontdef.cfg
358                                         %% if necessary
```

We also set some default values for `\f@family` etc. Note that we don't yet have any encodings that comes later. In the past this was implicitly done by `\DeclareErrorFont`.

```
359 \fontfamily{cmr}
360 \fontseries{m}
361 \fontshape{n}
362 \fontsize{10}{10}
```

The initial `fontenc` package load list. This will get overwritten in `fonttext` and is only provided in case an old `fonttext.cfg` does not define the command:

```
363 \def\@fontenc@load@list{\@elt{T1,OT1}}
```

We now load the customizable parts of NFSS.

```
364 \InputIfFileExists{fonttext.cfg}
365     {\typeout{=====^^J%
366               ^^J%
367               Local config file fonttext.cfg used^^J%
368               ^^J%
369               =====}%
370     \def\@addtofilelist##1{\xdef\@filelist{\@filelist,##1}}%
371     }
372     {\input{fonttext.ltx}}
373 \let\@addtofilelist\@gobble
```

Ditto for math although I don't think that we will get a lot of customisation :-)

```
374 \InputIfFileExists{fontmath.cfg}
375     {\typeout{=====^^J%
376               ^^J%
377               Local config file fontmath.cfg used^^J%
378               ^^J%
379               =====}%
380     \def\@addtofilelist##1{\xdef\@filelist{\@filelist,##1}}%
381     }
382     {\input{fontmath.ltx}}
383 \let\@addtofilelist\@gobble
```

Then we preload several fonts. This file might be customized *without* changing the behavior of the format (i.e. necessary font definitions will be loaded at runtime if they are not preloaded). This is done in the file `preload.ltx`.

```
384 \InputIfFileExists{preload.cfg}
385     {\typeout{=====^^J%
386               ^^J%
387               Local config file preload.cfg used^^J%
388               ^^J%
389               =====}%
```

```

390             \def\@addtofilelist##1{\xdef\@filelist{\@filelist,##1}}%
391             }
392             {\input{preload.ltx}}
393 \let\@addtofilelist\@gobble

\@acci We also save the values of some accents in \@acci, \@accii and \@acciii so they
\@accii can be restored by a minipage inside a tabbing environment.
\@acciii 394 \let\@acci\' \let\@accii\' \let\@acciii\=

\cal Here were the two old ⟨alphabet identifiers⟩.
\mit
395 </2ekernel>

```

File u

fontdef.dtx

j-latexreleasej [2020/02/11 v3.0g LaTeX Kernel (j-latexreleasej font setup)]

41 Introduction

This file is used to generate the files `fonttext.ltx` (text font declarations) and `fontmath.ltx` (math font declarations), which are used during the format generation. It contains the declaration of the standard text encodings used at the site as well as a minimal subset of font shape groups that NFSS will look at to ensure that the specified encodings are valid.

The math part contains the setup for math encodings as well as the default math symbol declarations that belong to the encoding.

It is possible to change this setup (by using other fonts, or defaults) without losing the ability to process documents written at other sites. Portability in this sense means that a document will compile without errors. It does not mean, however, that identical output will be produced. For this it is necessary that the distributed setup is used at both installations.

42 Customization

You are not allowed to change this source file! If you want to change the default encodings and/or the font shape groups preloaded you should create a copy of `fonttext.ltx` under the name `fonttext.cfg` and change this copy. If \LaTeX 2 ϵ finds a file of this name it will use it, otherwise it uses the standard file which is `fontdef.ltx`.

If you don't plan to use Computer Modern much or at all, it might (!) be a good idea to make your own `fonttext.cfg`. Look at the comments below (docstrip module 'text') to see what should go into such a file.

To change the math font setup use a copy of `fontmath.ltx` under the name `fontmath.cfg` and change this copy. However, dealing with this interface is even more a job for an expert than changing the text font setup — in short, we don't encourage either.

Warning: please note that we don't support customised \LaTeX versions. Thus, before sending in a bug report please try your test file with a \LaTeX format which is not customised and send in the log from that version (unless the problem goes away).

Please note: the following standard encodings have to be defined in all local variants of `font....cfg` to guarantee that all \LaTeX installations behave in the same way.

T1	Cork T _E X text encoding
OT1	old T _E X text encoding
U	unknown encoding
OML	old T _E X math letters encoding
OMS	old T _E X math symbols encoding
OMX	old T _E X math extension symbols encoding
TU	Unicode

Notice that some of these encodings are ‘old’ in the sense that we hope that they will be superseded soon by encoding standards defined by the T_EX user community. Therefore this set of default encodings may change in the future.

The first candidate is OT1 which will soon be replaced by T1, the official T_EX text encoding.

Warning: If you add additional encodings to this file there is no guarantee any longer that files processable at your installation will also be processable at other installations. Thus, if you make use of such an encoding in your document, e.g. if you intend to typeset in Cyrillic (OT2 encoding), you need to specify this encoding in the preamble of your document prior to sending it to another installation. Once the encoding is specified in that place in your document, the document is processable at all L^AT_EX installations (provided they have suitable fonts installed).

For this reason we suggest that you define a short package file that sets up an additional encoding used at your site (rather than putting the encoding into this file) since this package can easily be shipped with your document.

43 The docstrip modules

The following modules are used to direct **docstrip** in generating external files:

driver	produce a documentation driver file
text	produce the file fonttext.ltx
math	produce the file fontmath.ltx
cfgtext	produce a dummy fonttext.cfg file
cfgmath	produce a dummy fontmath.cfg file

A typical **docstrip** command file would then have entries like:

```
\generateFile{fonttext.ltx}{t}{\from{fontdef.dtx}{text}}
```

44 A driver for this document

The next bit of code contains the documentation driver file for T_EX, i.e. the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

```
1 (*driver)
2 \documentclass{ltxdoc}
3 \GetFileInfo{fontdef.dtx}
```

```

4 \begin{document}
5   \DocInput{fontdef.dtx}
6 \end{document}
7 \</driver>

```

45 The fonttext.ltx file

The identification is done earlier on with a `\ProvidesFile` declaration.

```

8 (*text)
9 \typeout{=== Don't modify this file, use a .cfg file instead ===^^J}

```

45.1 Encodings

This file declares the standard encodings for text and math fonts. All others should be declared in packages or in the documents directly.

For every text encoding there are normally a number of encoding specific commands, e.g. accents, special characters, etc. (The definition for such a command might have to change when the encoding is changed, because the character is in a different position, or not available at all, or the accent is produced in a different way.) This is handled by a general mechanism which is described in `ltoutenc.dtx`.

By convention, text encoding specific declarations, including the declaration `\DeclareFontEncoding`, are kept in separate file of the form `\enc\enc.def`, e.g. `ot1enc.def`. This allows other applications to make use of the declarations as well.

Similar to the default encoding, the loading of the encoding files for the two major text encodings shouldn't be changed. In particular, the `inputenc` package depends on this.

```

10 \input {omlenc.def}
11 \input {omsenc.def}

```

Documents containing a lot of accented characters should really be using T1 fonts. We therefore load this last so that T1 encoding specific commands are executed as fast as possible (encoding files are no longer reloaded in `fontenc`).

```

12 \input {ot1enc.def}
13 \input {t1enc.def}
14 \input{ts1enc.def}

```

```

15 \ifx\Umathchar\@undefined

```

We then set the default text font encoding. This will hopefully change some day to T1. This setting should *not* be changed to produce a portable format.

```

16 \fontencoding{OT1}

```

The initial `fontenc` package load list if an 8-bit \TeX engine is used:

```

17 \def\@fontenc@load@list{\@elt{T1,OT1}}
18 \def\rmsubstdefault{cmr}
19 \def\sfsubstdefault{cms}
20 \def\ttsubstdefault{cmtt}
21 \LoadFontDefinitionFile{TS1}{cmr}
22 \else

```

Unicode.

```
23 \input {tuenc.def}
24 \fontencoding{TU}
```

The initial fontenc package load list if a Unicode engine is used:

```
25 \def\@fontenc@load@list{\@elt{TU}}

26 \DeclareFontSubstitution{TU}{lmr}{m}{n}
27 \LoadFontDefinitionFile{TU}{lmr}
28 \LoadFontDefinitionFile{TU}{lms}
29 \LoadFontDefinitionFile{TU}{lmtt}

30 \def\rmsubstdefault{lmr}
31 \def\sfsubstdefault{lms}
32 \def\ttsubstdefault{lmtt}
33 \LoadFontDefinitionFile{TS1}{lmr}

34 \DeclareFontSubstitution{TU}{lmr}{m}{n}
```

End of Unicode branch.

```
35 \fi
```

If different encodings for text fonts are in use one could put the common setup into `\DeclareFontEncodingDefaults`. There is now a better mechanism so using this interface is discouraged!

```
36 \DeclareFontEncodingDefaults{}{}
```

Then we define the default substitution for every encoding. This release of $\text{\LaTeX 2}_{\epsilon}$ assumes that the ec fonts are available. It is possible to change this to point to some other font family (e.g., Times with the appropriate encoding if it is available) without making documents non-portable. However, in such a case documents will produce different page breaks at other sites. The substitution defaults can all be changed without losing portability as long as there are font shape definitions for the selected substitutions.

```
37 \DeclareFontSubstitution{T1}{cmr}{m}{n}
38 \DeclareFontSubstitution{OT1}{cmr}{m}{n}
```

For every encoding declaration, $\text{\LaTeX 2}_{\epsilon}$ will try to verify that the given substitution information makes sense, i.e. that it is impossible to go into an endless loop if font substitution happens. This is done at the moment the `\begin{document}` is encountered. $\text{\LaTeX 2}_{\epsilon}$ will then check that for every encoding the substitution defaults form a valid font shape group, which means that it will check if there is a `\DeclareFontShape` declaration for this combination. We will therefore load the corresponding .fd files now. If we don't do this they would be loaded at verification time (i.e. at `\begin{document}`) which would delay processing unnecessarily.

Warning: Please note that this means that you have to regenerate the format whenever you change any of these .fd files since $\text{\LaTeX 2}_{\epsilon}$ will not read .fd files if it already knows about the encoding/family combination.

The `\nfss@catcodes` ensures that white space is ignored in any definitions made in the fd files.

```
39 \begingroup
40 \nfss@catcodes
41 \input {t1cmr.fd}
```

```

42 \input {ot1cmr.fd}
43 \endgroup

```

We also load some other font definition files which are normally needed in a document. This is only done for processing speed and you can comment the next two lines out to save some memory. If necessary these files are then loaded when your document is processed. (Loading .fd files is a less drastic step compared to preloading fonts because the number of fonts is limited 255 at (nearly) every T_EX installation, while the amount of main memory is not a limiting factor at most installations.)

```

44 \begingroup
45 \nfss@catcodes
46 \input {ot1cmss.fd}
47 \input {ot1cmtt.fd}
48 \endgroup

```

Even with all the precautions it is still possible that NFSS will run into problems, for example, when a .fd file contains corrupted data. To guard against such cases NFSS has a very low-level fallback font that is installed with the following line.

```

49 \DeclareErrorFont{OT1}{cmr}{m}{n}{10}

```

This means, “if everything else fails use Computer Modern Roman normal shape at 10pt in the old text encoding”. You can change the font used but the encoding should be the same as the one specified with `\fontencoding` above.

45.2 Defaults

To allow the use of `\rmfamily`, `\sffamily`, etc. in documents even if non-standard families are used we provide nine macros which hold the name of the corresponding families, series, and so on. This makes it easy to use other font families (like Times Roman, etc.). One simply has to redefine these defaults.

All these hooks have to be defined in this file but you can change their meaning (except for `\encodingdefault`) without making documents non-portable.

```

\encodingdefault The following three definitions set up the meaning for \rmfamily, \sffamily, and
\rmdefault      \ttfamily.
\sfdefault      50 \ifx\Umathchar\@undefined
\ttdefault      51 \newcommand\encodingdefault{OT1}
                  52 \newcommand\rmdefault{cmr}
                  53 \newcommand\sfdefault{cmss}
                  54 \newcommand\ttdefault{cmtt}
                  55 \else
                  56 \newcommand\encodingdefault{TU}
                  57 \newcommand\rmdefault{lmr}
                  58 \fontfamily{\rmdefault}
                  59 \newcommand\sfdefault{lmss}
                  60 \newcommand\ttdefault{lmtt}
                  61 \fi
                  62 \</text>
                  63 \<latexrelease>\IncludeInRelease{2017/01/01}%
                  64 \<latexrelease>          {\encodingdefault}{TU encoding default}%
                  65 \<latexrelease>\ifx\Umathchar\@undefined

```

```

66 \latexrelease\renewcommand\encodingdefault{OT1}
67 \latexrelease\fontencoding{\encodingdefault}
68 \latexrelease\renewcommand\rmdefault{cmr}
69 \latexrelease\fontfamily{\rmdefault}
70 \latexrelease\renewcommand\sfddefault{cmss}
71 \latexrelease\renewcommand\ttdefault{cmtt}
72 \latexrelease\else
73 \latexrelease\renewcommand\encodingdefault{TU}
74 \latexrelease}%done in everyjob\fontencoding{\encodingdefault}
75 \latexrelease\renewcommand\rmdefault{lmr}
76 \latexrelease\fontfamily{\rmdefault}
77 \latexrelease\renewcommand\sfddefault{lms}
78 \latexrelease\renewcommand\ttdefault{lmtt}
79 \latexrelease\fi
80 \latexrelease\EndIncludeInRelease
81 \latexrelease\IncludeInRelease{0000/00/00}%
82 \latexrelease\           {\encodingdefault}{TU encoding default}%
83 \latexrelease\fontencoding{OT1}
84 \latexrelease\renewcommand\encodingdefault{OT1}
85 \latexrelease\fontencoding{\encodingdefault}
86 \latexrelease\renewcommand\rmdefault{cmr}
87 \latexrelease\fontfamily{\rmdefault}
88 \latexrelease\renewcommand\sfddefault{cmss}
89 \latexrelease\renewcommand\ttdefault{cmtt}
90 \latexrelease\EndIncludeInRelease
91 (*text)

```

`\bfdefault` Series changing commands are influenced by the following hooks.

```

\mddefault 92 \newcommand\bfdefault{b} % overwritten below
          93 \newcommand\mddefault{m}

```

`\itdefault` Shape changing commands use the following hooks.

```

\sldefault 94 \newcommand\itdefault{it}
\scdefault 95 \newcommand\sldefault{sl}
\updefault 96 \newcommand\scdefault{sc}
          97 \newcommand\updefault{up} % overwritten below

```

```

98 \text)
99 (*text | latexrelease)
100 \latexrelease\IncludeInRelease{2020/02/02}%
101 \latexrelease\           {\updefault}{font defaults change}%
102 \renewcommand\updefault{up}
103 \renewcommand\bfdefault{b}
104 \text | latexrelease)
105 \latexrelease\EndIncludeInRelease
106 \latexrelease\IncludeInRelease{0000/00/00}%
107 \latexrelease\           {\updefault}{font defaults change}%
108 \latexrelease\
109 \latexrelease\renewcommand\updefault{n}
110 \latexrelease\renewcommand\bfdefault{bx}
111 \latexrelease\EndIncludeInRelease
112 (*text)

```

`\familydefault` Finally we have the hooks that describe the behaviour of the `\normalfont` command. To stay portable, the definition of `\encodingdefault` should *not* be
`\seriesdefault`
`\shapedefault`

changed and should match the setting above for `\fontencoding`. All other values can be set according to your taste.

```
113 \newcommand\familydefault{\rmdefault}
114 \newcommand\seriesdefault{\mddefault}
```

In previous releases `\shapedefault` pointed to `\updefault` which resolved to `n`, but these days that is no longer the case (and `up` is wrong when you want to do a reset. So we now use `n` explicitly.

```
115 % \changes{v3.0e}{2019/12/17}{Set \cs{shapedefault} explicitly to ‘n’}
116 \newcommand\shapedefault{n}
```

This finishes the low-level setup in `fonttext.ltx`.

```
117 </text>
```

46 The fontmath.ltx file

The identification is done earlier on with a `\ProvidesFile` declaration.

```
118 (*math)
119 \typeout{=== Don't modify this file, use a .cfg file instead ===^J}
```

46.1 The font encodings used

```
120 \DeclareFontEncoding{OML}{-}{-}
121 \DeclareFontEncoding{OMS}{-}{-}
122 \DeclareFontEncoding{OMX}{-}{-}
```

Finally a declaration for U encoding which serves for all fonts that do not fit standard encodings. For math this sets up `\noaccents@` providing for AMS- \LaTeX . This macro is used therein to handle accented characters if they are not supported by the font. In other words, if fonts with U encoding are used in math, all accents (like from `\breve`) are obtained from some other font that has them.

```
123 \DeclareFontEncoding{U}{-}{\noaccents@}
```

The encodings for math are next:

```
124 \DeclareFontSubstitution{OML}{cmm}{m}{it}
125 \DeclareFontSubstitution{OMS}{cmsy}{m}{n}
126 \DeclareFontSubstitution{OMX}{cmex}{m}{n}
127 \DeclareFontSubstitution{U}{cmr}{m}{n}
```

```
128 \begingroup
129 \nfss@catcodes
130 \input {omlcmm.fd}
131 \input {omscmsy.fd}
132 \input {omxcmex.fd}
133 \input {ucmr.fd}
134 \endgroup
```

46.1.1 Symbolfont and Alphabet declarations

We now define the basic symbol fonts used by \LaTeX . These four symbol fonts must be defined by this file.

It is possible to make the symbol fonts point to other external fonts without losing the ability to process documents written at other sites, as long as one defines the same symbol font names with the same encodings, e.g. `operators` with OT1

etc. If other encodings are used documents become non-portable. Such a change should therefore be done in a package file.

```

135 \DeclareSymbolFont{operators}    {OT1}{cmr} {m}{n}
136 \DeclareSymbolFont{letters}     {OML}{cmm} {m}{it}
137 \DeclareSymbolFont{symbols}     {OMS}{cmsy}{m}{n}
138 \DeclareSymbolFont{largesymbols}{OMX}{cmex}{m}{n}

139 \SetSymbolFont{operators}{bold}{OT1}{cmr} {bx}{n}
140 \SetSymbolFont{letters}  {bold}{OML}{cmm} {b}{it}
141 \SetSymbolFont{symbols}  {bold}{OMS}{cmsy}{b}{n}

```

Below are the seven math alphabets which are defined by NFSS. Again they must be defined by this file. However, as before you can change the fonts used without losing portability, but you should be careful when changing the encoding since that may make documents come out wrong.

```

142 \DeclareSymbolFontAlphabet{\mathrm}    {operators}
143 \DeclareSymbolFontAlphabet{\mathnormal}{letters}
144 \DeclareSymbolFontAlphabet{\mathcal}   {symbols}
145 \DeclareMathAlphabet          {\mathbf} {OT1}{cmr}{bx}{n}
146 \DeclareMathAlphabet          {\mathsf} {OT1}{cmss}{m}{n}
147 \DeclareMathAlphabet          {\mathit} {OT1}{cmr}{m}{it}
148 \DeclareMathAlphabet          {\mathtt} {OT1}{cmtt}{m}{n}

```

Given the currently available fonts we cannot bold-en `\mathbf` and `\mathtt` but in principle one could use ‘ultra bold’ or something. The alphabets defined via `\DeclareSymbolFontAlphabet` will change automatically in a new math version if the corresponding symbol font changes.

```

149 \SetMathAlphabet\mathsf{bold}{OT1}{cmss}{bx}{n}
150 \SetMathAlphabet\mathit{bold}{OT1}{cmr}{bx}{it}

```

46.2 Math font sizes

The declarations below declare the text, script and scriptscript size to be used for each text font size.

All occurrences of sizes longer than a single character are replaced with the macro name that holds them, saving a number of tokens (but losing a bit of speed, so this may not stay this way).

```

151 \DeclareMathSizes{5}{5}{5}{5}
152 \DeclareMathSizes{6}{6}{5}{5}
153 \DeclareMathSizes{7}{7}{5}{5}
154 \DeclareMathSizes{8}{8}{6}{5}
155 \DeclareMathSizes{9}{9}{6}{5}
156 \DeclareMathSizes{\@xpt}{\@xpt}{7}{5}
157 \DeclareMathSizes{\@xipt}{\@xipt}{8}{6}
158 \DeclareMathSizes{\@xiipt}{\@xiipt}{8}{6}
159 \DeclareMathSizes{\@xivpt}{\@xivpt}{\@xpt}{7}
160 \DeclareMathSizes{\@xvipt}{\@xvipt}{\@xiipt}{\@xpt}
161 \DeclareMathSizes{\@xxpt}{\@xxpt}{\@xivpt}{\@xiipt}
162 \DeclareMathSizes{\@xxvpt}{\@xxvpt}{\@xxpt}{\@xvipt}

```

46.3 The math symbol assignments

We start by setting up math codes for most of the characters typed in directly from the keyboard. Most of them are normally already setup up in the same way

by \LaTeX . However, we repeat them here to have a complete setup which can be exchanged with another if desired.

46.3.1 The letters

```

163 \DeclareMathSymbol{a}{\mathalpha}{letters}{'a}
164 \DeclareMathSymbol{b}{\mathalpha}{letters}{'b}
165 \DeclareMathSymbol{c}{\mathalpha}{letters}{'c}
166 \DeclareMathSymbol{d}{\mathalpha}{letters}{'d}
167 \DeclareMathSymbol{e}{\mathalpha}{letters}{'e}
168 \DeclareMathSymbol{f}{\mathalpha}{letters}{'f}
169 \DeclareMathSymbol{g}{\mathalpha}{letters}{'g}
170 \DeclareMathSymbol{h}{\mathalpha}{letters}{'h}
171 \DeclareMathSymbol{i}{\mathalpha}{letters}{'i}
172 \DeclareMathSymbol{j}{\mathalpha}{letters}{'j}
173 \DeclareMathSymbol{k}{\mathalpha}{letters}{'k}
174 \DeclareMathSymbol{l}{\mathalpha}{letters}{'l}
175 \DeclareMathSymbol{m}{\mathalpha}{letters}{'m}
176 \DeclareMathSymbol{n}{\mathalpha}{letters}{'n}
177 \DeclareMathSymbol{o}{\mathalpha}{letters}{'o}
178 \DeclareMathSymbol{p}{\mathalpha}{letters}{'p}
179 \DeclareMathSymbol{q}{\mathalpha}{letters}{'q}
180 \DeclareMathSymbol{r}{\mathalpha}{letters}{'r}
181 \DeclareMathSymbol{s}{\mathalpha}{letters}{'s}
182 \DeclareMathSymbol{t}{\mathalpha}{letters}{'t}
183 \DeclareMathSymbol{u}{\mathalpha}{letters}{'u}
184 \DeclareMathSymbol{v}{\mathalpha}{letters}{'v}
185 \DeclareMathSymbol{w}{\mathalpha}{letters}{'w}
186 \DeclareMathSymbol{x}{\mathalpha}{letters}{'x}
187 \DeclareMathSymbol{y}{\mathalpha}{letters}{'y}
188 \DeclareMathSymbol{z}{\mathalpha}{letters}{'z}

189 \DeclareMathSymbol{A}{\mathalpha}{letters}{'A}
190 \DeclareMathSymbol{B}{\mathalpha}{letters}{'B}
191 \DeclareMathSymbol{C}{\mathalpha}{letters}{'C}
192 \DeclareMathSymbol{D}{\mathalpha}{letters}{'D}
193 \DeclareMathSymbol{E}{\mathalpha}{letters}{'E}
194 \DeclareMathSymbol{F}{\mathalpha}{letters}{'F}
195 \DeclareMathSymbol{G}{\mathalpha}{letters}{'G}
196 \DeclareMathSymbol{H}{\mathalpha}{letters}{'H}
197 \DeclareMathSymbol{I}{\mathalpha}{letters}{'I}
198 \DeclareMathSymbol{J}{\mathalpha}{letters}{'J}
199 \DeclareMathSymbol{K}{\mathalpha}{letters}{'K}
200 \DeclareMathSymbol{L}{\mathalpha}{letters}{'L}
201 \DeclareMathSymbol{M}{\mathalpha}{letters}{'M}
202 \DeclareMathSymbol{N}{\mathalpha}{letters}{'N}
203 \DeclareMathSymbol{O}{\mathalpha}{letters}{'O}
204 \DeclareMathSymbol{P}{\mathalpha}{letters}{'P}
205 \DeclareMathSymbol{Q}{\mathalpha}{letters}{'Q}
206 \DeclareMathSymbol{R}{\mathalpha}{letters}{'R}
207 \DeclareMathSymbol{S}{\mathalpha}{letters}{'S}
208 \DeclareMathSymbol{T}{\mathalpha}{letters}{'T}
209 \DeclareMathSymbol{U}{\mathalpha}{letters}{'U}
210 \DeclareMathSymbol{V}{\mathalpha}{letters}{'V}
211 \DeclareMathSymbol{W}{\mathalpha}{letters}{'W}

```

```

212 \DeclareMathSymbol{X}{\mathalpha}{letters}{'X}
213 \DeclareMathSymbol{Y}{\mathalpha}{letters}{'Y}
214 \DeclareMathSymbol{Z}{\mathalpha}{letters}{'Z}

```

46.3.2 The digits

```

215 \DeclareMathSymbol{0}{\mathalpha}{operators}{'0}
216 \DeclareMathSymbol{1}{\mathalpha}{operators}{'1}
217 \DeclareMathSymbol{2}{\mathalpha}{operators}{'2}
218 \DeclareMathSymbol{3}{\mathalpha}{operators}{'3}
219 \DeclareMathSymbol{4}{\mathalpha}{operators}{'4}
220 \DeclareMathSymbol{5}{\mathalpha}{operators}{'5}
221 \DeclareMathSymbol{6}{\mathalpha}{operators}{'6}
222 \DeclareMathSymbol{7}{\mathalpha}{operators}{'7}
223 \DeclareMathSymbol{8}{\mathalpha}{operators}{'8}
224 \DeclareMathSymbol{9}{\mathalpha}{operators}{'9}

```

46.3.3 Punctuation, brace, etc. keys

```

225 \DeclareMathSymbol{!}{\mathclose}{operators}{"21}
226 \DeclareMathSymbol{*}{\mathbin}{symbols}{"03} % \ast
227 \DeclareMathSymbol{+}{\mathbin}{operators}{"2B}
228 \DeclareMathSymbol{,}{\mathpunct}{letters}{"3B}
229 \DeclareMathSymbol{-}{\mathbin}{symbols}{"00}
230 \DeclareMathSymbol{.}{\mathord}{letters}{"3A}
231 \DeclareMathSymbol{:}{\mathrel}{operators}{"3A}
232 \DeclareMathSymbol{;}{\mathpunct}{operators}{"3B}
233 \DeclareMathSymbol{=}{\mathrel}{operators}{"3D}
234 \DeclareMathSymbol{?}{\mathclose}{operators}{"3F}

```

The following symbols are defined as delimiters below which automatically defines them as math symbols.

```

235 %\DeclareMathSymbol{({\mathopen}{operators}{"28}
236 %\DeclareMathSymbol{)}{\mathclose}{operators}{"29}
237 %\DeclareMathSymbol{/}{\mathord}{letters}{"3D}
238 %\DeclareMathSymbol{[}{\mathopen}{operators}{"5B}
239 %\DeclareMathSymbol{]}{\mathclose}{operators}{"5D}
240 %\DeclareMathSymbol{|}{\mathord}{symbols}{"6A}
241 %\DeclareMathSymbol{<}{\mathrel}{letters}{"3C}
242 %\DeclareMathSymbol{>}{\mathrel}{letters}{"3E}

```

Should all of the following being activated by default? Probably not.

```

243 %\DeclareMathSymbol{\}{\mathopen}{symbols}{"66}
244 %\DeclareMathSymbol{\'}{\mathclose}{symbols}{"67}
245 %\DeclareMathSymbol{\'}{\mathord}{symbols}{"6E} % \backslash
246 \mathcode'\ =8000 % \space
247 \mathcode\' =8000 % ^\prime
248 \mathcode\'_ =8000 % \_

```

46.3.4 Delimitercodes for characters

[to be completed]

Finally, `InitTeX` sets all `\delcode` values to -1, except `\delcode' = 0`

```

249 \DeclareMathDelimiter{({\mathopen}{operators}{"28}{largesymbols}{"00}
250 \DeclareMathDelimiter{)}{\mathclose}{operators}{"29}{largesymbols}{"01}
251 \DeclareMathDelimiter{[}{\mathopen}{operators}{"5B}{largesymbols}{"02}
252 \DeclareMathDelimiter{]}{\mathclose}{operators}{"5D}{largesymbols}{"03}

```

The next two are considered to be relations when not used in the context of a delimiter! And worse, they do even represent different glyphs when being used as delimiter and not as delimiter. This is a user level syntax inherited from plain \TeX . Therefore we explicitly redefine the math symbol definitions for these symbols afterwards.

```
253 \DeclareMathDelimiter{<}{\mathopen}{symbols}{"68}{largesymbols}{"0A}
254 \DeclareMathDelimiter{>}{\mathclose}{symbols}{"69}{largesymbols}{"0B}
255 \DeclareMathSymbol{<}{\mathrel}{letters}{"3C}
256 \DeclareMathSymbol{>}{\mathrel}{letters}{"3E}
```

And here is another case where the non-delimiter version produces a glyph different from the delimiter version.

```
257 \DeclareMathDelimiter{/}{\mathord}{operators}{"2F}{largesymbols}{"0E}
258 \DeclareMathSymbol{/}{\mathord}{letters}{"3D}

259 \DeclareMathDelimiter{|}{\mathord}{symbols}{"6A}{largesymbols}{"0C}
260 \expandafter\DeclareMathDelimiter\@backslashchar
261           {\mathord}{symbols}{"6E}{largesymbols}{"0F}
```

N.B. { and } should NOT get delcodes; otherwise parameter grouping fails!

46.4 Symbols accessed via control sequences

46.4.1 Greek letters

```
262 \DeclareMathSymbol{\alpha}{\mathord}{letters}{"0B}
263 \DeclareMathSymbol{\beta}{\mathord}{letters}{"0C}
264 \DeclareMathSymbol{\gamma}{\mathord}{letters}{"0D}
265 \DeclareMathSymbol{\delta}{\mathord}{letters}{"0E}
266 \DeclareMathSymbol{\epsilon}{\mathord}{letters}{"0F}
267 \DeclareMathSymbol{\zeta}{\mathord}{letters}{"10}
268 \DeclareMathSymbol{\eta}{\mathord}{letters}{"11}
269 \DeclareMathSymbol{\theta}{\mathord}{letters}{"12}
270 \DeclareMathSymbol{\iota}{\mathord}{letters}{"13}
271 \DeclareMathSymbol{\kappa}{\mathord}{letters}{"14}
272 \DeclareMathSymbol{\lambda}{\mathord}{letters}{"15}
273 \DeclareMathSymbol{\mu}{\mathord}{letters}{"16}
274 \DeclareMathSymbol{\nu}{\mathord}{letters}{"17}
275 \DeclareMathSymbol{\xi}{\mathord}{letters}{"18}
276 \DeclareMathSymbol{\pi}{\mathord}{letters}{"19}
277 \DeclareMathSymbol{\rho}{\mathord}{letters}{"1A}
278 \DeclareMathSymbol{\sigma}{\mathord}{letters}{"1B}
279 \DeclareMathSymbol{\tau}{\mathord}{letters}{"1C}
280 \DeclareMathSymbol{\upsilon}{\mathord}{letters}{"1D}
281 \DeclareMathSymbol{\phi}{\mathord}{letters}{"1E}
282 \DeclareMathSymbol{\chi}{\mathord}{letters}{"1F}
283 \DeclareMathSymbol{\psi}{\mathord}{letters}{"20}
284 \DeclareMathSymbol{\omega}{\mathord}{letters}{"21}
285 \DeclareMathSymbol{\varepsilon}{\mathord}{letters}{"22}
286 \DeclareMathSymbol{\vartheta}{\mathord}{letters}{"23}
287 \DeclareMathSymbol{\varpi}{\mathord}{letters}{"24}

```

In contrast to `plain.tex` `\Relbar` got braces around the equal sign to guard against it being “math active” expanding to `\futurelet...`. This might be the case when packages are implementing shorthands for math, e.g. `=>` meaning `\Rightarrow` etc. It would actually be better not to use `=` in such definitions but instead define something like `\mathequalsign` and use this. However we can’t

do this now as it would break other math layouts where characters are in different places (since those wouldn't know about the need for a new command name).

```

```

`\lgroup` There are three plain T_EX delimiters which are not fully supported by NFSS,
`\rgroup` since they partly point into a bold cmr font. Allocating a full symbol font, just
`\bracevert` to have three delimiters seems a bit too much given the limited space available.
 For this reason only the extensible sizes are supported. If this is not desired one

can use, without losing portability, define `\mathbf` and `\mathtt` as font symbol alphabet (setting up `cmr/bx/n` and `cmtt/m/n` as symbol fonts first) and modify the delimiter declarations to point with their small variant to those symbol fonts. (This is done in `oldlfont.dtx` so look there for examples.)

```
602 \DeclareMathDelimiter{\lgroup} % extensible ( with sharper tips
603     {\mathopen}{largesymbols}{"3A}{largesymbols}{"3A}
604 \DeclareMathDelimiter{\rgroup} % extensible ) with sharper tips

File v

preload.dtx

48 Overview

This file contains an number of possible settings for preloading fonts during installation of NFSS2 (which is used by L^AT_EX 2_ε). It will be used to generate the following files:

preload.min	minimal subset of fonts necessary to run NFSS2
preload.ori	preload of CM fonts similar to the old <code>lfonts.tex</code>
preload.ltx	The standard selection of preloads
cmpreloa.xpt	preload of CM fonts for 10pt document size
cmpreloa.xip	preload of CM fonts for 11pt document size
cmpreloa.xii	preload of CM fonts for 12pt document size
depreloa.xpt	preload of DC fonts for 10pt size
depreloa.xip	preload of DC fonts for 11pt size
depreloa.xii	preload of DC fonts for 12pt size

These files are for installations that make use of Computer Modern fonts either old encoding (OT1) or Cork encoding (T1). The Computer Modern fonts with Cork encoding are known as DC-fonts.

Most important is `preload.ltx` which is used during format generation. You are *not* allowed to change this file.

49 Customization

You can customize the preloaded fonts in your L^AT_EX 2_ε system by installing a file with the name `preload.cfg`. If this file exists it will be used in place of the system file `preload.ltx`. You can, for example, copy one of the files mentioned above (that can be generated from this source) to `preload.cfg`.

Or you can define completely other preloads. In that case start from `preload.min` since that contains the fonts that have to be preloaded by **all** L^AT_EX 2_ε systems.

Avoid using `preload.ori`, it will load so many fonts that on most installations it is nearly impossible to load other font families afterwards. This file is only generated to show what fonts have been preloaded by L^AT_EX 2.09.

If you normally use other fonts than Computer Modern `preload.min` might be best.

Warning: If you preload fonts with encodings other than the normally supported encodings you have to declare that encoding in a `fontdef.cfg` configuration file (see the documentation in the file `fontdef.dtx`). Adding an extra encoding to the format might produce non-portable documents, thus this should be avoided if possible.

50 Module switches for the DOCSTRIP program

The DOCSTRIP will generate the above file from this source using the following module directives:

driver	produce a documentation driver file
preload	produce a preload...file
cm	for OT1 encoded Computer Modern
dc	for T1 encoded Computer Modern
min	produce minimal subset
xpt	produce 10pt preloads
xipt	produce 11pt preloads
xipt	produce 12pt preloads
ori	produce preloads similar to old <code>lfonts.tex</code>
tex	produce preload.ltx

A typical DOCSTRIP command file would then have entries like:

```
\generateFile{preload.min}{t}{\from{preload.dtx}{preload,min}}
```

for generating preload files.

51 A driver for this document

The next bit of code contains the documentation driver file for T_EX, i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

```
1 (*driver)
2 \documentclass{ltxdoc}
3 %\OnlyDescription % comment out for implementation details
4 \begin{document}
5   \DocInput{preload.dtx}
6 \end{document}
7 \end{driver}
```

52 The code

We begin by loading the math extension font (cmex10) and the L^AT_EX line and circle fonts. It is necessary to do this explicitly since these are used by `lplain.tex` and `latex.tex`. Since the internal font name contains / characters and digits we construct the name via `\csname`. These are the only fonts (!) that must be loaded in this file.

All `\DeclarePreloadSizes` can be removed or others can be added, they only influence the processing speed.

```
8 \expandafter\font\csname OMX/cmex/m/n/10\endcsname=cmex10\relax
9 \font\tenln =line10 \font\tenlnw =linew10\relax
10 \font\tencirc=lcircle10 \font\tencircw=lcirclew10\relax
```

The above fonts should not be touched but anything below this point here in the preload suggestions can be modified without any problems.

```
11 (-tex)%*****
```

```

12 (-tex)% Start any modification below this point **
13 (-tex)%*****
14 (-tex)

File w

lftntcmd.dtx

Abstract

The commands defined in this file `lftntcmd` are part of the kernel code for $\text{\LaTeX 2}_{\epsilon}$ /NFSS2.

It is also meant to serve as documentation for package writers since it demonstrates how to define high-level font changing commands using a small number of creator functions.

53 Introduction

Font changes such as `\bfseries`, `\sffamily`, etc. are declarations; this means that their scope is delimited by the grouping structure, either by the next `\end` of some environment or by explicitly using a group, e.g., writing something like `{\bfseries...}` in the source. If you make the mistake of writing `\bfseries{...}` (thinking of `\bfseries` as a command with one argument) then the result is rather striking.

Font declarations are an artifact of the \TeX system and for several reasons it is better to avoid them on the user level whenever possible. In \LaTeX 3 they will probably all be replaced by environments and by font commands taking one argument.

This file defines a creator function for such declarative font switches. This function creates commands which can be used in both math and text.

This file also defines a number of high-level commands (all starting with `\text..`) that have one argument and typeset this argument in the requested way. Thus these commands are for typesetting short pieces of text in a specific family, series or shape. These are all produced as examples of the use of a creator function which is itself also defined in this file.

Table 1 shows all these high-level commands in action. A further advantage of using these commands is that they automatically take care of any necessary italic correction on either side of their argument.

Thus, when using such commands, one does not have to worry about forgetting the italic correction when changing fonts. Only in very few situations is this additional space wrong but, for example, most typographers recommend omitting the italic correction if a small punctuation character, like a comma, directly follows the font change. Since the amount of correction required is partly a matter of taste, you can define in what situations the italic correction should be suppressed. This is done by putting the characters that should cancel a preceding italic correction in the list `\nocorrlist`.⁹ The default definition for this list is produced by the following.

```
\newcommand \nocorrlist {,.}
```

⁹Any package that changes the `\catcode` of a character inside `\nocorrlist` must then explicitly reset the list. Otherwise the changed character will no longer be recognized by the suppression algorithm.

<i>Command</i>	<i>Corresponds to</i>	<i>Action</i>
<code>\textnormal{..}</code>	<code>\normalfont</code>	Typeset argument in normal family
<code>\textrm{..}</code>	<code>\rmfamily</code>	Typeset argument in roman family
<code>\textsf{..}</code>	<code>\sffamily</code>	Typeset argument in sans serif family
<code>\texttt{..}</code>	<code>\ttfamily</code>	Typeset argument in typewriter family
<code>\textmd{..}</code>	<code>\mdseries</code>	Typeset argument in medium series
<code>\textbf{..}</code>	<code>\bfseries</code>	Typeset argument in bold series
<code>\textup{..}</code>	<code>\upshape</code>	Typeset argument in normal shape
<code>\textit{..}</code>	<code>\itshape</code>	Typeset argument in <i>italic</i> shape
<code>\textsl{..}</code>	<code>\slshape</code>	Typeset argument in <i>slanted</i> shape
<code>\textsc{..}</code>	<code>\scshape</code>	Typeset argument in SMALL CAPS shape
<code>\emph{..}</code>	<code>\em</code>	Typeset argument <i>emphasized</i>

Table 1: Font-change commands with arguments

The font change commands provided here all start with `\text..` to emphasize that they are for use in normal text and to be easily memorable. They automatically take care of any necessary italic correction on either side of the argument.

It is best to declare the most often used characters first, because this will make the processing slightly faster. For example,

```
\emph{When using the \NFSS{} high-level commands,
the \emph{proper} use of italic corrections is
automatically taken care of}. Only
\emph{sometimes} one has to help \LaTeX{} by
adding a \verb=\nocorr= command.
```

which results in:

When using the NFSS high-level commands, the proper use of italic corrections is automatically taken care of. Only sometimes one has to help L^AT_EX by adding a \nocorr command.

In contrast, the use of the declaration forms is often more appropriate when you define your own commands or environments.

```
\newenvironment{bfitemize}{\begin{itemize}\normalfont\bfseries}
{\end{itemize}}
\begin{bfitemize}
\item This environment produces boldface items.
\item It is defined in terms of \LaTeX's
\texttt{itemize} environment and NFSS
declarations.
\end{bfitemize}
```

This gives:

- This environment produces boldface items.
- It is defined in terms of L^AT_EX's `itemize` environment and NFSS declarations.

In addition to global customization of when to insert the italic correction, it is of course sometimes necessary to explicitly insert one with `\/`.

It is also possible to suppress the italic correction in individual instances. For this, the command `\nocorr` is provided.

The `\nocorr` must appear as the first or last token inside the braces of the argument of the `\text...` commands, at that end of the text where you wish to suppress the italic correction.

It is worth pointing out here that inserting a `\/` in places where it can have no function (i.e. anywhere except immediately after a slanted letter) is not an error—it will just be silently ignored. Unfortunately this is not true if the redefinition of `\/` in `amstex.sty` is used as this version can cause space to be removed immediately before the `\/`.

54 The implementation

`\DeclareTextFontCommand` This is the creator function for `\text..` commands. It gives a warning if `\foo` or `\fragfoo` is already defined.

In math mode it simply puts the font declaration and text into a box (possibly an automagically sized one).

Otherwise it first scans the text to see where `\nocorr` occurs within it. This sets the `\check@ic` commands to do what is necessary concerning the italic correction at both ends.

The algorithm for deciding whether to put in an italic correction is not very subtle: one is added whenever the newly current font is not itself positively sloped, unless the next token is a character in the ‘nocorr’ list. At the end of the text this is done after closing the group so as to check the ‘outer font’. Note that this will often result in adding an italic correction token after a character in an unsloped font; we believe (in early 2003) that this is perhaps inefficient but not dangerous.

It also now checks for empty contents of the text command and optimises this case. Some care is also taken to check that doing dangerous things in vertical mode is avoided.

The italic correction token is added to the horizontal list before (in the list) an immediately preceding non-zero glob of glue (skip) and any non-zero penalty preceding that since, in the typical case, this puts it immediately after the last character in the preceding word.

Note that it is necessary to put in the `\aftergroup\maybe@ic` at the end of the group so that it comes after any other aftergroup tokens and immediately before the following tokens. It is also necessary to remove the `\fi` from the token list before the group ends; this is done by adding an `\expandafter` just before the closing brace.

```

1 (*2kernel)
2 \def \DeclareTextFontCommand #1#2{%
3   \DeclareRobustCommand#1[1]{%
4     \ifmmode
5       \nfss@text{#2##1}%

```

```

6      \else
7      \hmode\bgroup
8      \text@command{##1}%
9      #2\check@icl ##1\check@icr
10     \expandafter
11     \egroup
12     \fi
13         }%
14 }

\textrm Now we define the \text{family} commands in terms of the above; \texttt does
\textsf not look very nice!
\texttt 15 \DeclareTextFontCommand{\textrm}{\rmfamily}
\textnormal 16 \DeclareTextFontCommand{\textsf}{\sffamily}
17 \DeclareTextFontCommand{\texttt}{\ttfamily}
18 \DeclareTextFontCommand{\textnormal}{\normalfont}

\textbf For the series attribute:
\textmd 19 \DeclareTextFontCommand{\textbf}{\bfseries}
20 \DeclareTextFontCommand{\textmd}{\mdseries}

\textit And for the shapes:
\textsl 21 \DeclareTextFontCommand{\textit}{\itshape}
\textsc 22 \DeclareTextFontCommand{\textsl}{\slshape}
\textup 23 \DeclareTextFontCommand{\textsc}{\scshape}
24 \DeclareTextFontCommand{\textup}{\upshape}

textulc
textsw 25 \if2kernel
textssc 26 \if*2kernel | latexrelease
27 \if latexrelease \IncludeInRelease{2020/02/02}%
28 \if latexrelease {\textulc}{Additional text commands}%
29 \DeclareTextFontCommand{\textulc}{\ulcshape}
30 \DeclareTextFontCommand{\textsw}{\swshape}
31 \DeclareTextFontCommand{\textssc}{\sscshape}
32 \if2kernel | latexrelease
33 \if latexrelease \EndIncludeInRelease
34 \if latexrelease \IncludeInRelease{0000/00/00}%
35 \if latexrelease {\textulc}{Additional text commands}%
36 \if latexrelease
37 \if latexrelease \let\textulc\@undefined
38 \if latexrelease \let\textsw\@undefined
39 \if latexrelease \let\textssc\@undefined
40 \if latexrelease \EndIncludeInRelease
41 \if*2kernel

\emph Finally we have the \em font change declaration of LATEX. The corresponding
definition with argument is
42 \DeclareTextFontCommand{\emph}{\em}

\nocorr This is just a label, so it does nothing; it should also be unexpandable.
43 \let \nocorr \relax

```

`\check@icl` We define these defaults in case some error causes them to be expanded at the wrong time.

```
44 \let \check@icl \@empty
45 \let \check@icr \@empty
```

`\text@command` This checks for a `\nocorr` as the first token in its argument and also for one in any other position not protected within braces (the latter is treated as if it were at the end of the argument).

`\check@nocorr@`

Is this the correct action in the ‘empty’ case? It is efficient but typographically it is, strictly, incorrect!

```
46 \def \text@command #1{%
47   \def \reserved@a {#1}%
48   \ifx \reserved@a \@empty
49     \let \check@icl \@empty
50     \let \check@icr \@empty
51   \else
```

`\space` is a reserved word in \LaTeX or actually already in plain \TeX . If somebody really redefines it so many things will break that I don’t see any reason to make this routine here slower than necessary.

```
52 %   \def \reserved@b { }%
53 %   \ifx \reserved@a \reserved@b
54   \ifx \reserved@a \space
55     \let \check@icl \@empty
56     \let \check@icr \@empty
57   \else
58     \check@nocorr@ #1\nocorr\@nil
59   \fi
60 \fi
61 }
62 \def \check@nocorr@ #1#2\nocorr#3\@nil {%
```

The two checks are initialised here to their values in the normal case.

```
63 \let \check@icl \maybe@ic
64 \def \check@icr {\ifvmode \else \aftergroup \maybe@ic \fi}%
65 \def \reserved@a {\nocorr}%
66 \def \reserved@b {#1}%
67 \def \reserved@c {#3}%
68 \ifx \reserved@a \reserved@b
69   \ifx \reserved@c \@empty
```

In this case there is a `\nocorr` at the start but not at the end, so `\check@icl` should be empty.

```
70   \let \check@icl \@empty
71   \else
```

Otherwise there is a `\nocorr` both at the start and elsewhere, so no italic corrections should be added.

```
72   \let \check@icl \@empty
73   \let \check@icr \@empty
74   \fi
75 \else
76   \ifx \reserved@c \@empty
```

In this case there is no `\nocorr` anywhere, so we need to check for an italic correction at both the beginning and the end. This has been set up as the default so no code is needed here.

```
77 \else
```

In this case there is no `\nocorr` at the start but there is one elsewhere, so no `\aftergroup` is needed.

```
78 \let \check@icr \@empty
79 \fi
80 \fi
81 }
```

`\ifmaybe@ic` Switch used solely within `\maybe@ic` not interfering with other switches.

```
82 \newif\ifmaybe@ic
```

`\maybe@ic` These macros implement the italic correction.

```
\maybe@ic@ 83 \def \maybe@ic {\futurelet\@let@token\maybe@ic@}
84 \def \maybe@ic@ {%
```

We first check to see if the current font is positively sloped. (But do not forget the message Rainer sent about an upright font with non-zero slope! Or is this an urban myth?) It has been suggested that this should test against a small positive value, but what?

```
85 \ifdim \fontdimen\@ne\font>\z@
86 \else
87 \maybe@ictrue
```

It would be possible, but probably not worthwhile, to continue the forward scan beyond any closing braces.

```
88 \expandafter\@tfor\expandafter\reserved@a\expandafter:\expandafter=%
89 \nocorrlist
```

We have to hide the `\@let@token` in the macro `\t@st@ic` rather than testing it directly in the loop since it might be `\let` to a `\fi` or `\else`, which would result in chaos.

```
90 \do \t@st@ic
```

Frank thinks that the next bit it is inefficient if done after the second change. Chris thinks that most all of this is inefficient for the commonest cases: but that is the price of a cleverer algorithm. It is certainly needed to deal with the use of `\nolinebreak`.

```
91 \ifmaybe@ic \sw@slant \fi
92 \fi
93 }
```

`\t@st@ic` The next token in the input stream is stored in `\@let@token` via a `\let`, the current token from `\nocorrlist` is stored via `\def` in `\reserved@a`. To compare them we have to fiddle around a bit.

If the only things to check were characters then this could be done via an `\if` thus their catcodes would not matter; but this will not work whilst `\futurelet` is used above.

```
94 \def \t@st@ic {%
95 \expandafter\let\expandafter\reserved@b\expandafter=\reserved@a\relax
96 \ifx\reserved@b\@let@token
```

If they are the same we record the fact and jump out of the loop.

```

97     \maybe@icfalse
98     \@break@tfor
99     \fi
100 }

```

`\sw@slant` The definition of the mysterious `\sw@slant` command is as follows.
`\fix@penalty` 101 `\def \sw@slant {%`

It is surely correct to put in an italic correction when there is no skip. If the last thing on the list is actually a zero skip (including things whose dimension part is zero, such as `\hfill`), or anything other than a character, then the italic correction will have no effect.

In order to work correctly with unbreakable spaces from `~` (and other common forms of line-breaking control) we also move back across a penalty before the glue.

```

102 \ifdim \lastskip=\z@
103   \fix@penalty
104 \else
105   \skip@ \lastskip
106   \unskip
107   \fix@penalty
108   \hskip \skip@
109 \fi
110 }

```

The above code means: “If there is a non-zero space just before the current position (`\ifdim...`) save the amount of that space (`\skip@ \lastskip`), remove it (`\unskip`), then do a similar thing if there is a penalty just before the skip, and finally put the space back in.”

Since zero glue cannot be distinguished in this context from no glue, we dare not put in an `\hskip` in this case as this may produce an unwanted breakpoint. This is not satisfactory.

The penalty before the glue is handled similarly, with the same caveats concerning the zero case. Is this the first recorded use of `\unpenalty` in standard L^AT_EX code?

```

111 \def \fix@penalty {%
112   \ifnum \lastpenalty=\z@
113     \@@italiccorr
114   \else
115     \count@ \lastpenalty
116     \unpenalty
117     \@@italiccorr
118     \penalty \count@
119   \fi
120 }

```

`\nocorrlist` This holds the list of characters that should prevent italic correction. They should be ordered by decreasing frequency of use. If any such character is made active later on one needs to redefine the list so that the active character becomes part of it.

```

121 \def \nocorrlist {, .}

```

`\nfss@text` This command will by default behave like a L^AT_EX `\mbox` but may be redefined by packages such as `amstext.sty` to be a bit cleverer.

```
122 \ifx \nfss@text\undefined
123   \def \nfss@text {\leavevmode\hbox}
124 \fi
```

`\DeclareOldFontCommand` This is the function used to create declarative font-changing commands that can also be used to change alphabets in math-mode.

Usage: `\DeclareOldFontCommand \fn{<font-change decls>} <math-alphabet>`

Here `\fn` is the font-declaration command being defined, `<font-change decls>` is the declaration it will expand to in text-mode, and `<math-alphabet>` is the (single) math alphabet specifier which is to be used in math-mode.

It does not care whether the command being defined already exists but it does give a warning if it redefines anything.

Here are some typical examples of its use in conjunction with more basic NFSS2 font commands.

```
\DeclareOldFontCommand{\rm}{\normalfont\rmfamily}{\mathrm}
\DeclareOldFontCommand{\sf}{\normalfont\sffamily}{\mathsf}
\DeclareOldFontCommand{\tt}{\normalfont\ttfamily}{\mathtt}
```

```
125 \def \DeclareOldFontCommand #1#2#3{%
126   \DeclareRobustCommand #1{\@fontswitch {#2}{#3}}%
127 }
```

`\@fontswitch` These two commands actually do the necessary tests and declarative font- or alphabet-changing.

```
\@@math@egroup
\@@math@egroup
128 \def \@fontswitch #1#2{%
129   \ifmmode
130     \let \math@bgroup \relax
131     \def \math@egroup {\let \math@bgroup \@math@bgroup
132                       \let \math@egroup \@math@egroup}%
133   \else
134     \let \math@bgroup \relax
135     \def \math@egroup {\let \math@bgroup \@math@bgroup
136                       \let \math@egroup \@math@egroup}%
137 }
```

We need to have a `\relax` in the following line in case the `#2` is something like `\mathsf` grabbing the next token as an argument. For this reason the code also uses explicit arguments again (see pr/1275).

```
133   #2\relax
134   \else
135     #1%
136   \fi
137 }
138 \let \@math@bgroup \math@bgroup
139 \let \@math@egroup \math@egroup
```

These commands are available only in the preamble.

```
140 \onlypreamble \DeclareTextFontCommand
141 \onlypreamble \DeclareOldFontCommand
```

55 Initialization

```
\normalsize This is defined to produce an error.
142 \def\normalsize{%
143   \@latex@error {The font size command \protect\normalsize\space
144                 is not defined:\MessageBreak
145                 there is probably something wrong with
146                 the class file}\@eha
147 }
148 </2ekernel>
```

File x

lttextcomp.dtx

This file contains the implementation for accessing the glyphs provided by the TS1 encoding (Text Companion Encoding). This is now offered as part of the kernel and so the `textcomp` package which used to provide the definitions is now mainly needed for compatibility reasons (and doesn't do much any more).

`\oldstylenums` Preserve the old definition of `\oldstylenums` under a different name.
`\legacyoldstylenums` This macro implements old style numerals but only works if we assume that the standard math fonts are used. Thus it needs changing in case other math encodings are used.

```
1 (*2ekernel | latexrelease)
2 (latexrelease)\IncludeInRelease{2020/02/02}%
3 (latexrelease)          {\oldstylenums}{Old style numerals}%
4 \DeclareRobustCommand\legacyoldstylenums[1]{%
5   \begingroup
```

Provide spacing using the interword space of the current font.

```
6   \spaceskip\fontdimen\tw@\font
```

Then switch to the math italic font. We don't change the current value of `\f@series` which means that you can use bold numerals if `\bfseries` is in force. As family we use `\rmdefault` which means that this only works if there exist an OML encoded version of that font or rather a corresponding `.fd` file (which is the case for standard L^AT_EX fonts even though they only contain substitutions).

```
7   \usefont{OML}{\rmdefault}{\f@series}{it}%
8   \mathgroup\symletters #1%
9   \endgroup
10 }
```

And here is the improved one that adjusts depending on surroundings.

```
11 \DeclareRobustCommand\oldstylenums[1]{%
12   \begingroup
13   \ifmmode
14     \mathgroup\symletters #1%
15   \else
```

The `\CheckEncodingSubset` is discussed below.

```
16   \CheckEncodingSubset\@use@text@encoding{TS1}\tc@oldstylesubst2{\#1}%
17   \fi
18   \endgroup
19 }
```

The helper to select the substitution if needed.

```
20 \def\tc@oldstylesubst#1{%
21   \tc@errorwarn
22     {Oldstyle digits unavailable for
23     family \f@family.\MessageBreak
24     Default oldstyle digits used instead}\@eha
25   \bgroup
26     \expand@font@defaults
```

The substitution defaults are provided in the file `fonttext.ltx`.

```

27     \ifx\f@family\rmdef@ult
28         \fontfamily\rmsubstdefault
29     \else\ifx\f@family\sfddef@ult
30         \fontfamily\sfsbstdefault
31     \else\ifx\f@family\ttdef@ult
32         \fontfamily\ttsbstdefault
33     \else
34         \fontfamily\textcompsubstdefault
35     \fi\fi\fi
36     \fontencoding{TS1}\selectfont#1%
37 \egroup
38 }

```

`\textcompsubstdefault` Here is the default for the “unknown” case:

```

39 \def\textcompsubstdefault{\rmsubstdefault}

40 </2ekernel | latexrelease>
41 <latexrelease>\EndIncludeInRelease
42 <latexrelease>\IncludeInRelease{0000/00/00}%
43 <latexrelease>           {\oldstylenums}{Old style numerals}%
44 <latexrelease>
45 <latexrelease>\DeclareRobustCommand\oldstylenums[1]{%
46 <latexrelease>     \begingroup
47 <latexrelease>     \spaceskip\fontdimen\tw@\font
48 <latexrelease>     \usefont{OML}{\rmdefault}{\f@series}{it}%
49 <latexrelease>     \mathgroup\symletters #1%

51 <latexrelease>}
52 <latexrelease>\let\legacyoldstylenums\@undefined
53 <latexrelease>\def\textcompsubstdefault{cmr}
54 <latexrelease>
55 <latexrelease>\EndIncludeInRelease

```

Everything else in this file got introduced 2020/02/02, so we do a single rollback (for now).

```

56 <*2ekernel>
57 </2ekernel>
58 <*2ekernel | latexrelease>
59 <latexrelease>\IncludeInRelease{2020/02/02}%
60 <latexrelease>     {\DeclareEncodingSubset}{Text companion symbols}%

```

`\DeclareEncodingSubset` The declaration takes 3 mandatory arguments: an *encoding* for which a subsetting is wanted (currently always TS1, and most likely forever), the *font family* for which we declare the subset and finally the *subset* number (between 0 (all of the encoding is supported) and 9 many glyphs are missing).

For TS1 the numbers have been chosen in a way that most fonts can be fairly correctly categorized, but the default settings are always conservative, that is they may claim that less glyphs are supported than there actually are.

As these days many font families are set up to end in -LF (lining figures), -OsF (oldstyle figures), etc. the declaration supports a shortcut: if the *font family* name ends in -* then the star gets replaced by these common ending, e.g.,

```
\DeclareEncodingSubset{TS1}{Alegreya-*}{2}
```

is the same as writing

```
\DeclareEncodingSubset{TS1}{Alegreya-LF}{2}
\DeclareEncodingSubset{TS1}{Alegreya-OfF}{2}
\DeclareEncodingSubset{TS1}{Alegreya-TLF}{2}
\DeclareEncodingSubset{TS1}{Alegreya-TOfF}{2}
```

If only some are needed then one can define them individually but in many cases all four are wanted, hence the shortcut.

The coding of the declaration has no error checking as it is mostly for internal use.

```
61 \def\DeclareEncodingSubset#1#2{%
62   \DeclareEncodingSubset@aux{#1}#2*\DeclareEncodingSubset@aux
63 }
64 \def\DeclareEncodingSubset@aux#1#2*#3\DeclareEncodingSubset@aux#4{%
if #3 is empty then there was no star, otherwise we define all four variants.
65   \expandafter\ifx\expandafter X\detokenize{#3}X%
66     \@DeclareEncodingSubset{#1}{#2}{#4}%
67   \else
68     \@DeclareEncodingSubset{#1}{#2LF}{#4}%
69     \@DeclareEncodingSubset{#1}{#2TLF}{#4}%
70     \@DeclareEncodingSubset{#1}{#2OfF}{#4}%
71     \@DeclareEncodingSubset{#1}{#2TOfF}{#4}%
72   \fi
73 }
```

The subset info is stored in a command with the name `\family:subset` so if that already exists we change otherwise declare a subset.

```
74 \def\@DeclareEncodingSubset#1#2#3{%
75   \ifundefined{#1:#2}%
76     {\@font@info{Setting #2 sub-encoding to #1/#3}}%
77     {\@font@info{Changing #2 sub-encoding to #1/#3}}%
78   \@namedef{#1:#2}{#3}}
```

Any reason to allow those in the middle of documents?

```
79 \onlypreamble\DeclareEncodingSubset
80 \onlypreamble\DeclareEncodingSubset@aux
81 \onlypreamble\@DeclareEncodingSubset
```

`\CheckEncodingSubset` The command `\CheckEncodingSubset` will check if the current font family has the right encoding subset to typeset a certain command. It takes five arguments as follows: first argument is either `\UseTextSymbol`, `\UseTextAccent` depending on whether or not the symbol is a text symbol or a text accent.

The second argument is the encoding from which this symbol should be fetched.

The third argument is either a fake accessor command or an error message. the code in that argument (if ever executed) receives two arguments: `#2` and `#5` of `\CheckEncodingSubset`.

Argument four is the subset encoding id to test against: if this value is higher than the subset id of the current font family then we typeset the symbol, i.e., execute `#1{#2}#5` otherwise it runs `#3#5`, e.g., to produce an error message or fake the glyph somehow.

Argument five is the symbol or accent command that is being checked.

For usage examples see definitions below.

```

82 \def\CheckEncodingSubset#1#2#3#4#5{%
83   \ifnum #4>%
84     \expandafter\ifx\csname #2:\f@family\endcsname\relax
85     0\csname #2:?\endcsname
86   \else
87     \csname #2:\f@family\endcsname
88   \fi
89   \relax
90   \expandafter\@firstoftwo
91 \else
92   \expandafter\@secondoftwo
93 \fi
94   {#1{#2}}{#3}%
95   #5%
96 }

```

To set up the glyphs for the subsets we need a number helpers.

`\tc@errorwarn` To we produce errors, warnings, or only info in the transcripts if glyphs require substitutions? By default it is “info” only. With the `textcomp` package that can be changed.

```

97 \def\tc@errorwarn#1#2{\@latex@info{#1}}

```

`\tc@subst`

```

98 \def\tc@subst#1{%
99   \tc@errorwarn
100   {Symbol \string#1 not provided by\MessageBreak
101     font family \f@family\space
102     in TS1 encoding.\MessageBreak Default family used instead}\@eha
103   \bgroup
104     \expand@font@defaults
105     \ifx\f@family\rmdef@ult
106       \fontfamily\rmsubstdefault
107     \else\ifx\f@family\sfsdef@ult
108       \fontfamily\sfsbstdefault
109     \else\ifx\f@family\ttdef@ult
110       \fontfamily\ttsbstdefault
111     \else
112       \fontfamily\textcompsubstdefault
113     \fi\fi\fi

```

Whatever default was chosen, we claim now (locally hopefully) that it can handle all slots (even if not true) to avoid looping in certain situations, e.g., when something was set up incorrectly.

```

114     \@namedef{TS1:\f@family}{0}%
115     \selectfont#1%
116   \egroup
117 }

```

`\tc@fake@euro` `\tc@fake@euro` is an example of a “fake” definition to use in arg #3 of `\CheckEncodingSubset` when a symbol is not available in a certain font family. Here we produce a poor man’s Euro symbol by combining a “C” with a “=”.

```

118 \def\tc@fake@euro#1{%
119     \leavevmode
120     \@font@info{Faking \noexpand#1for font family
121                 \f@family\MessageBreak in TS1 encoding}%
122     \valign{##\cr
123         \vfil\hbox to 0.07em{\dimen@\f@size\p@
124                             \math@fontsfalse
125                             \fontsize{.7\dimen@}\z@\selectfont=\hss}%
126         \vfil\cr%
127         \hbox{C}\crrcr
128     }%
129 }

```

\tc@check@symbol These are two abbreviations that we use below to check symbols and accents in
\tc@check@accent TS1. Only there to save some space, e.g., we can then write

```
\DeclareTextCommandDefault{\textcurrency}{\tc@check@symbol3\textcurrency}
```

to ensure that `\textcurrency` is only typeset if the current font has a TS1 subset id of less than 3. Otherwise `\tc@error` is called telling the user that for this font family `\textcurrency` is not available.

```
130 \def\tc@check@symbol{\CheckEncodingSubset\UseTextSymbol{TS1}\tc@subst}
```

Accents and been mad an error in the `textcomp` package when not available. Now that we provide the functionality in the kernel we avoid the error by swapping in a T1 accent if the TS1 accent is not available.

```
131 %\def\tc@check@accent{\CheckEncodingSubset\UseTextAccent{TS1}\tc@error}
```

```
132 \def\tc@check@accent#1{\CheckEncodingSubset\UseTextAccent{TS1}{\tc@swap@accent#1}}
```

```
133 \def\tc@swap@accent#1#2{\UseTextAccent{T1}#1}
```

56 Sub-encodings

Here are the default definitions for the TS1 symbols. First those that we assume are always available if a font implements TS1.

```

134 \DeclareTextSymbolDefault{\textdollar}{TS1}
135 \UndeclareTextCommand{\textdollar} {OT1} % don't use the OT1 def any longer
136 \DeclareTextSymbolDefault{\textsterling}{TS1}
137 \UndeclareTextCommand{\textsterling}{OT1} % don't use the OT1 def any longer
138 \DeclareTextSymbolDefault{\textperthousand}{TS1}
139 \UndeclareTextCommand{\textperthousand}{T1} % don't use the T1 def

```

Using `\UndeclareTextCommand` above is enough only if the encoding definition files are not reloaded afterwards. In the past that happened if `fontenc` was used in the document preamble (not not any longer). So in some sense it is better to fully remove them from the encoding files, but for rollbacks it is easier to keep them in for now.

These are the standard `itemize` and footnote symbols originally taken from OMS and now from TS1:

```

140 \DeclareTextSymbolDefault{\textasteriskcentered}{TS1}
141 \DeclareTextSymbolDefault{\textbullet}{TS1}
142 \DeclareTextSymbolDefault{\textdaggerdbl}{TS1}

```

```

143 \DeclareTextSymbolDefault{\textdagger}{TS1}
144 \DeclareTextSymbolDefault{\textparagraph}{TS1}
145 \DeclareTextSymbolDefault{\textperiodcentered}{TS1}
146 \DeclareTextSymbolDefault{\textsection}{TS1}

```

And here are the other TS1 glyphs that are implemented by every font (or nearly everyone—a few are commented out and moved to sub-encoding 9, because they aren’t around in one or two fonts.

```

147 %%\DeclareTextSymbolDefault{\textbardbl}{TS1} % subst in sub-enc 9 above
148 \DeclareTextSymbolDefault{\textbrokenbar}{TS1}
149 %%\DeclareTextSymbolDefault{\textcelsius}{TS1} % subst in sub-enc 9 above
150 \DeclareTextSymbolDefault{\textcent}{TS1}
151 \DeclareTextSymbolDefault{\textcopyright}{TS1}
152 \DeclareTextSymbolDefault{\textdegree}{TS1}
153 \DeclareTextSymbolDefault{\textdiv}{TS1}
154 \DeclareTextSymbolDefault{\textlnot}{TS1}
155 \DeclareTextSymbolDefault{\textonehalf}{TS1}
156 \DeclareTextSymbolDefault{\textonequarter}{TS1}
157 %%\DeclareTextSymbolDefault{\textonesuperior}{TS1} % subst in sub-enc 9 above
158 \DeclareTextSymbolDefault{\textordfeminine}{TS1}
159 \DeclareTextSymbolDefault{\textordmasculine}{TS1}
160 \DeclareTextSymbolDefault{\textpm}{TS1}
161 \DeclareTextSymbolDefault{\textquotesingle}{TS1}
162 \DeclareTextSymbolDefault{\textquotestraightbase}{TS1}
163 \DeclareTextSymbolDefault{\textquotestraightdblbase}{TS1}
164 \DeclareTextSymbolDefault{\textregistered}{TS1}
165 %%\DeclareTextSymbolDefault{\textthreequartersemdash}{TS1} % subst in sub-enc 9 above
166 \DeclareTextSymbolDefault{\textthreequarters}{TS1}
167 %%\DeclareTextSymbolDefault{\textthreesuperior}{TS1} % subst in sub-enc 9 above
168 \DeclareTextSymbolDefault{\textttimes}{TS1}
169 \DeclareTextSymbolDefault{\texttrademark}{TS1}
170 %%\DeclareTextSymbolDefault{\texttwelveudash}{TS1} % subst in sub-enc 9 above
171 %%\DeclareTextSymbolDefault{\textttwosuperior}{TS1} % subst in sub-enc 9 above
172 \DeclareTextSymbolDefault{\textyen}{TS1}

173 \DeclareTextSymbolDefault{\textcapitalcompwordmark}{TS1}
174 \DeclareTextSymbolDefault{\textascendercompwordmark}{TS1}

```

In the following sections the remaining default definitions are ordered by sub-encoding in which they are become unavailable (i.e., they are not provided in the sub-encoding with that number and all sub-encodings with higher numbers.

Thus the symbols that are available in sub-encoding x are the symbols above (always available) and the symbols list in the sections for sub-encodings $x + 1$ and higher.

56.1 Sub-encoding 1 (drop symbols not working in Latin Modern)

The `\textcircled` is available but the glyph is simply too small so we keep using the OMS glyph.

```

175 \DeclareTextCommandDefault{\textcircled}
176 {\CheckEncodingSubset\UseTextAccent{TS1}{\UseTextAccent{OMS}}1\textcircled}

```

56.2 Sub-encoding 2 (majority of new OTF fonts via autoinst)

```
177 \DeclareTextCommandDefault{\t}
178 {\CheckEncodingSubset\UseTextAccent{TS1}{\UseTextAccent{OML}}2\t}
```

Capital accents are really only very seldom implemented, so from sub-encoding 2 onwards we use the normal T1 accents if they are asked for in the document.

In Unicode engines we don't implement them at all but always use the basic accents instead. whether that works or not really depends on the font, something like "X usually comes out wrong in Unicode engines.

```
179 \ifx\Umathcode\@undefined
180 \DeclareTextCommandDefault{\capitalacut} {\tc@check@accent{\'}2\capitalacut}
181 \DeclareTextCommandDefault{\capitalbreve} {\tc@check@accent{\u}2\capitalbreve}
182 \DeclareTextCommandDefault{\capitalcaron} {\tc@check@accent{\v}2\capitalcaron}
183 \DeclareTextCommandDefault{\capitalcedilla} {\tc@check@accent{\c}2\capitalcedilla}
184 \DeclareTextCommandDefault{\capitalcircumflex} {\tc@check@accent{\^}2\capitalcircumflex}
185 \DeclareTextCommandDefault{\capitaldieresis} {\tc@check@accent{\"}2\capitaldieresis}
186 \DeclareTextCommandDefault{\capitaldotaccent} {\tc@check@accent{\.}2\capitaldotaccent}
187 \DeclareTextCommandDefault{\capitalgrave} {\tc@check@accent{\`}2\capitalgrave}
188 \DeclareTextCommandDefault{\capitalhungarumlaut} {\tc@check@accent{\H}2\capitalhungarumlaut}
189 \DeclareTextCommandDefault{\capitalmacron} {\tc@check@accent{\=}2\capitalmacron}
190 \DeclareTextCommandDefault{\capitalogonek} {\tc@check@accent{\k}2\capitalogonek}
191 \DeclareTextCommandDefault{\capitalring} {\tc@check@accent{\r}2\capitalring}
192 \DeclareTextCommandDefault{\capitaltie} {\tc@check@accent{\t}2\capitaltie}
193 \DeclareTextCommandDefault{\capitaltilde} {\tc@check@accent{\~}2\capitaltilde}
```

For \newtie and \capitalnewtie this is actually wrong, they should pick up the accent from the substitution font (not done yet).

```
194 \DeclareTextCommandDefault{\newtie} {\tc@check@accent{\t}2\newtie}
195 \DeclareTextCommandDefault{\capitalnewtie} {\tc@check@accent{\t}2\capitalnewtie}
```

In Unicode engines we just execute the simple accents:

```
196 \else
197 \def\capitalacut{\@tabacckludge'}
198 \def\capitalbreve{\u}
199 \def\capitalcaron{\v}
200 \def\capitalcedilla{\c}
201 \def\capitalcircumflex{\^}
202 \def\capitaldieresis{\"}
203 \def\capitaldotaccent{\.}
204 \def\capitalgrave{\@tabacckludge`}
205 \def\capitalhungarumlaut{\H}
206 \def\capitalmacron{\@tabacckludge=}
207 \def\capitalnewtie{\t}
208 \def\capitalogonek{\k}
209 \def\capitalring{\r}
210 \def\capitaltie{\t}
211 \def\capitaltilde{\~}
212 \def\newtie{\t}
213 \fi
```

The next two symbols exist in some fonts (faked?), but we ignore that to keep the subsets reasonable compact and most important linear.

```
214 \DeclareTextCommandDefault{\textlbrackdbl} {\tc@check@symbol2\textlbrackdbl}
215 \DeclareTextCommandDefault{\textrbrackdbl} {\tc@check@symbol2\textrbrackdbl}
```

Old style numerals are again in some fonts but using `-OsF`, etc. is the better approach to get them, so we claim they aren't in sub-encoding 2 as that's true for most fonts.

```

216 \DeclareTextCommandDefault{\texteightoldstyle} {\tc@check@symbol2\texteightoldstyle}
217 \DeclareTextCommandDefault{\textfiveoldstyle} {\tc@check@symbol2\textfiveoldstyle}
218 \DeclareTextCommandDefault{\textfouroldstyle} {\tc@check@symbol2\textfouroldstyle}
219 \DeclareTextCommandDefault{\textnineoldstyle} {\tc@check@symbol2\textnineoldstyle}
220 \DeclareTextCommandDefault{\textoneoldstyle} {\tc@check@symbol2\textoneoldstyle}
221 \DeclareTextCommandDefault{\textsevenoldstyle} {\tc@check@symbol2\textsevenoldstyle}
222 \DeclareTextCommandDefault{\textsixoldstyle} {\tc@check@symbol2\textsixoldstyle}
223 \DeclareTextCommandDefault{\textthreeoldstyle} {\tc@check@symbol2\textthreeoldstyle}
224 \DeclareTextCommandDefault{\texttwooldstyle} {\tc@check@symbol2\texttwooldstyle}
225 \DeclareTextCommandDefault{\textzerooldstyle} {\tc@check@symbol2\textzerooldstyle}

```

The next set of glyphs is special to TeX fonts (and available with a few older PS fonts supported in the virtual fonts), but not any longer in the majority of fonts provided through autostint, so we pretend there aren't available in sub-encoding 2 and below.

```

226 \DeclareTextCommandDefault{\textacutedbl} {\tc@check@symbol2\textacutedbl}
227 \DeclareTextCommandDefault{\textasciiaacute} {\tc@check@symbol2\textasciiaacute}
228 \DeclareTextCommandDefault{\textasciibreve} {\tc@check@symbol2\textasciibreve}
229 \DeclareTextCommandDefault{\textasciicaron} {\tc@check@symbol2\textasciicaron}
230 \DeclareTextCommandDefault{\textasciidieresis} {\tc@check@symbol2\textasciidieresis}
231 \DeclareTextCommandDefault{\textasciigrave} {\tc@check@symbol2\textasciigrave}
232 \DeclareTextCommandDefault{\textasciimacron} {\tc@check@symbol2\textasciimacron}
233 \DeclareTextCommandDefault{\textgravedbl} {\tc@check@symbol2\textgravedbl}
234 \DeclareTextCommandDefault{\texttildelow} {\tc@check@symbol2\texttildelow}

```

Finally those below are only available in CM-based fonts but in no font that has its origin outside of the T_EX world.

```

235 \DeclareTextCommandDefault{\textbaht} {\tc@check@symbol2\textbaht}
236 \DeclareTextCommandDefault{\textbigcircle} {\tc@check@symbol2\textbigcircle}
237 \DeclareTextCommandDefault{\textborn} {\tc@check@symbol2\textborn}
238 \DeclareTextCommandDefault{\textcentoldstyle} {\tc@check@symbol2\textcentoldstyle}

```

```

260 \DeclareTextCommandDefault{\textservicemark} {\tc@check@symbol2\textservicemark}
261 \DeclareTextCommandDefault{\textsurd} {\tc@check@symbol2\textsurd}

```

The `\textpertenthousand` also belongs in this group but here we have a choice: in T1 there is definition for `\textpertenthousand` making the symbol up from % and `\char 24` (twice) but in many fonts that char doesn't exist and the slot is reused for random ligatures. So better not use it because often it is wrong. But pointing to TS1 is also not great as only a few fonts have it as a real symbol, so we get a substitution to CM or LM.

Alternatively we could just state that the symbol is unavailable in those fonts. For now I substitute.

```

262 \DeclareTextCommandDefault{\textpertenthousand} {\tc@check@symbol2\textpertenthousand}
263 \UndeclareTextCommand{\textpertenthousand}{T1}

```

56.3 Sub-encoding 3

Sub-encoding 2 is the one where we loose many symbols. In the higher-numbered sub-encodings we see only a few dropped additionally.

```

264 \DeclareTextCommandDefault{\textlangle} {\tc@check@symbol3\textlangle}
265 \DeclareTextCommandDefault{\textrangle} {\tc@check@symbol3\textrangle}

```

56.4 Sub-encoding 4

```

266 \DeclareTextCommandDefault{\textcolonmonetary} {\tc@check@symbol4\textcolonmonetary}

271 \DeclareTextCommandDefault{\textrightarrow} {\tc@check@symbol4\textrightarrow}
272 \DeclareTextCommandDefault{\textuparrow} {\tc@check@symbol4\textuparrow}
273 \DeclareTextCommandDefault{\textwon} {\tc@check@symbol4\textwon}

```

56.5 Sub-encoding 5 (most older PS fonts)

Most older PS fonts (supported in T_EX since the early nineties when virtual fonts became available) are sorted under this sub-encoding. But in reality, many of them don't have all glyphs that should be available in sub-encoding 5. Instead they show little squares, i.e., they produce "tofu" if you are unlucky.

But the coverage is so random that it is impossible to sort them properly and if we tried to ensure that they only typeset those glyphs that are really always available wouput put them all into sub-encoding 9 so that's a compromise really.

Modern fonts that don't typeset a tofu character if a glyph is missing are only cataloged as sub-encoding 5 if they really support of its glyph set.

```

274 \DeclareTextCommandDefault{\textestimated} {\tc@check@symbol5\textestimated}
275 \DeclareTextCommandDefault{\textnumero} {\tc@check@symbol5\textnumero}

```

56.6 Sub-encoding 6

```

276 \DeclareTextCommandDefault{\textflorin} {\tc@check@symbol6\textflorin}
277 \DeclareTextCommandDefault{\textcurrency} {\tc@check@symbol6\textcurrency}

```

56.7 Sub-encoding 7

```

278 \DeclareTextCommandDefault{\textfractionsolidus}{\tc@check@symbol7\textfractionsolidus}
279 \DeclareTextCommandDefault{\textohm} {\tc@check@symbol7\textohm}

```

```

280 \DeclareTextCommandDefault{\textmu}          {\tc@check@symbol7\textmu}
281 \DeclareTextCommandDefault{\textminus}       {\tc@check@symbol7\textminus}

```

56.8 Sub-encoding 8

```

282 \DeclareTextCommandDefault{\textblank}       {\tc@check@symbol{8}\textblank}
283 \DeclareTextCommandDefault{\textinterrobangdown}{\tc@check@symbol{8}\textinterrobangdown}
284 \DeclareTextCommandDefault{\textinterrobang}  {\tc@check@symbol{8}\textinterrobang}

```

Fonts with this sub-encoding don't have a Euro symbol, but instead of substituting we fake it.

```

285 \DeclareTextCommandDefault{\texteuro}
286      {\CheckEncodingSubset\UseTextSymbol{TS1}\tc@fake@euro{8}\texteuro}

```

56.9 Sub-encoding 9 (most missing)

```

287 \DeclareTextCommandDefault{\textcelsius}{\tc@check@symbol{9}\textcelsius}
288 \DeclareTextCommandDefault{\textonesuperior}{\tc@check@symbol{9}\textonesuperior}
289 \DeclareTextCommandDefault{\textthreequartersemdash}{\tc@check@symbol{9}\textthreequartersemdash}
290 \DeclareTextCommandDefault{\textthreesuperior}{\tc@check@symbol{9}\textthreesuperior}
291 \DeclareTextCommandDefault{\texttwelveudash}{\tc@check@symbol{9}\texttwelveudash}
292 \DeclareTextCommandDefault{\texttwosuperior}{\tc@check@symbol{9}\texttwosuperior}
293 \DeclareTextCommandDefault{\textbardbl}{\tc@check@symbol{9}\textbardbl}

```

57 Unicode engine specials

If we are using a unicode engine we handle some glyphs differently, so this here are the definitions for the Unicode encoding (overwriting the defaults above).

```

294 \ifx \Umathcode\@undefined \else

```

This set should be taken from TS1 encoding even if it means you get it from the default font for that encoding.

```

295 %\DeclareTextSymbol{\textcopyleft}{TS1}{171}
296 %\DeclareTextSymbol{\textdblhyphen}{TS1}{45}
297 %\DeclareTextSymbol{\textdblhyphenchar}{TS1}{127}
298 %\DeclareTextSymbol{\textquotestraightbase}{TS1}{13}
299 %\DeclareTextSymbol{\textquotestraightdblbase}{TS1}{18}
300 %\DeclareTextSymbol{\textleaf}{TS1}{108}
301 %\DeclareTextSymbol{\texttwelveudash}{TS1}{21}
302 %\DeclareTextSymbol{\textthreequartersemdash}{TS1}{22}

```

If oldstyle numerals are asked for we just use \oldstylenums.

```

303 \DeclareTextCommand{\textzerooldstyle} \UnicodeEncodingName{\oldstylenums{0}}
304 \DeclareTextCommand{\textoneoldstyle} \UnicodeEncodingName{\oldstylenums{1}}
305 \DeclareTextCommand{\texttwooldstyle} \UnicodeEncodingName{\oldstylenums{2}}
306 \DeclareTextCommand{\textthreeoldstyle} \UnicodeEncodingName{\oldstylenums{3}}
307 \DeclareTextCommand{\textfouroldstyle} \UnicodeEncodingName{\oldstylenums{4}}
308 \DeclareTextCommand{\textfiveoldstyle} \UnicodeEncodingName{\oldstylenums{5}}
309 \DeclareTextCommand{\textsixoldstyle} \UnicodeEncodingName{\oldstylenums{6}}
310 \DeclareTextCommand{\textsevenoldstyle} \UnicodeEncodingName{\oldstylenums{7}}
311 \DeclareTextCommand{\texteightoldstyle} \UnicodeEncodingName{\oldstylenums{8}}
312 \DeclareTextCommand{\textnineoldstyle} \UnicodeEncodingName{\oldstylenums{9}}

```

These have Unicode slots so this should be integrated into TU explicitly

```

313 \DeclareTextSymbol{\textpilcrow} \UnicodeEncodingName{"00B6}
314 \DeclareTextSymbol{\textborn} \UnicodeEncodingName{"002A}

```

```

315 \DeclareTextSymbol{\textdied}          \UnicodeEncodingName{"2020}
316 \DeclareTextSymbol{\textlbrackdbl}     \UnicodeEncodingName{"27E6}
317 \DeclareTextSymbol{\textrbrackdbl}     \UnicodeEncodingName{"27E7}
318 \DeclareTextSymbol{\textguarani}       \UnicodeEncodingName{"20B2}

We could make \textcentoldstyle and \textdollaroldstyle point to dollar
and cent in the Unicode encoding

319 %\DeclareTextSymbol{\textcentoldstyle} \UnicodeEncodingName{"00A2}
320 %\DeclareTextSymbol{\textdollaroldstyle} \UnicodeEncodingName{"0024}

but I think it is better to pick them up from TS1 even if that usually means LMR
fonts

321 \DeclareTextSymbol{\textdollaroldstyle}{TS1}{138}
322 \DeclareTextSymbol{\textcentoldstyle} {TS1}{139}

323 \fi                                % --- END of Unicode engines specials

```

58 Font family sub-encodings setup

We declare the subsets for a good number of fonts in the kernel ...

But first the default for anything that is not declared. We use 9 which is most likely much too conservative, but with the advantage that we aren't getting missing glyphs (or at least that this is very unlikely). For nearly all font in the T_EX Live distribution of 2019 "correct" classifications are given below, so that this default is only used for new font families, and over time the right classifications can be added here too.

```

324 \DeclareEncodingSubset{TS1}{?}{9}

```

This first block contains the fonts that have been already supported by the `textcomp` package way back, i.e., the font families that have T_EX support since the mid-nineties.

```

325 \DeclareEncodingSubset{TS1}{ccr}      {0}

```

Below are the newer fonts that have support files for L^AT_EX. With very few exceptions the classifications are done so that all characters are correctly produced (either being available in the font or substituted).

There are a few fonts that contain “tofu” squares in places (instead of a real glyph) and in a few cases some really seldom needed chars are unavailable, i.e., produce missing glyphs (to avoid that a large number of available chars are unnecessarily substituted).

```

60 The textcomp package

```

722 \*TS1sty
723 \providecommand\DeclareRelease[3]{}
724 \providecommand\DeclareCurrentRelease[2]{}
725
726 \DeclareRelease{}{2018-08-11}{textcomp-2018-08-11.sty}
727 \DeclareCurrentRelease{}{2020-02-02}
728
729 \ProvidesPackage{textcomp}
730 [2020/02/02 v2.0n Standard LaTeX package]

```

A precaution in case this is used without rebuilding the format.

```
731 \NeedsTeXFormat{LaTeX2e}[2020/02/02]
```

This is implemented by defining the default subset:

```

732 \DeclareOption{full}{\DeclareEncodingSubset{TS1}{?}{0}}
733 \DeclareOption{almostfull}{\DeclareEncodingSubset{TS1}{?}{1}}
734 \DeclareOption{euro}{\DeclareEncodingSubset{TS1}{?}{8}}
735 \DeclareOption{safe}{\DeclareEncodingSubset{TS1}{?}{9}}

```

The default is set up in the kernel is “safe” these days for unknown fonts but LaTeX has definitions for most families so it seldom applies.

If a different default is used then one needs to check the results to ensure that there aren't “missing glyphs”.

The next set of options define the warning level (default in the kernel is info only). Using the package options you can change this behavior.

```
736 \DeclareOption{error}{\gdef\tc@errorwarn{\PackageError{textcomp}}}
737 \DeclareOption{warn}{\gdef\tc@errorwarn#1#2{\PackageWarning{textcomp}{#1}}}
738 \DeclareOption{info}{\gdef\tc@errorwarn#1#2{\PackageInfo{textcomp}{#1}}}
739 \DeclareOption{quiet}{\gdef\tc@errorwarn#1#2{}}
```

The “force” option basically changes the sub-encoding to that of the default (which, unless changes, is 9 these days), i.e., it no longer depends on the font in use. This is mainly there because it might have been used in older documents, but not something that is recommended.

```
740 \DeclareOption{force}{%
741   \def\CheckEncodingSubset#1#2#3#4#5{%
742     \ifnum #4>%
743       0\csname #2:\endcsname
744       \relax
745     \expandafter\@firstoftwo
746   \else
747     \expandafter\@secondoftwo
748   \fi
749   {#1{#2}}{#3}%
750   #5}%
751 }
752 \ExecuteOptions{info}
753 \ProcessOptions\relax
```

There is not much else to do nowadays, because everything is already set up in the L^AT_EX kernel.

```
754 \InputIfFileExists{textcomp.cfg}
755 {\PackageInfo{textcomp}{Local configuration file used}}{}
756 \</TS1sty>
```

60.1 The old textcomp package code

This section contains the old code for the textcomp package and its documentation. It is only used if we roll back prior to 2020. Thus all the rest is mainly for historians. Note that the old code categorised in the sub-encodings only into 6 classes not 10.

```
757 \<TS1oldsty>
758 \ProvidesPackage{textcomp}
759 [2018/08/11 v2.0j Standard LaTeX package]
```

This one is for the TS1 encoding which contains text symbols for use with the T1-encoded text fonts. It therefore first inputs the file `TS1enc.def` and then sets (or resets) the defaults for the symbols it contains. The result of this is that when one of these symbols is accessed and the current encoding does not provide it, the symbol will be supplied by a silent, local change to this encoding.

Since many PostScript fonts only implement a subset of TS1 many commands only produce black blobs of ink. To resolve the resulting problems a number of options have been introduced and some code has been developed to distinguish sub-encodings.

The sub-encodings have a numerical id and are defined as follows for TS1:

#5 those TS1 symbols that are also in the ISO-Adobe character set; without `textcurrency`, which is often misused for the Euro. Older Type1 fonts from the non-TeX world provide only this subset.

#4 = **#5** + `\texteuro`. Most newer fonts provide this.

#3 = **#4** + `\textomega`. Can also be described as $TS1 \cap (ISO-Adobe \cup MacRoman)$. (Except for the missing "currency".)

#2 = **#3** + `\textestimated` + `textcurrency`. Can also be described as $TS1 \cap Adobe-Western-2$. This may be relevant for OpenType fonts, which usually show the Adobe-Western-2 character set.

#1 = TS1 without `\textcircled` and `\t`. These two glyphs are often not implemented and if their kernel defaults are changed commands like `\copyright` unnecessarily fail.

#0 = full TS1

And here a summary to go in the transcript file:

```
760 \PackageInfo{textcomp}{Sub-encoding information:\MessageBreak
761   \space\space 5 = only ISO-Adobe without
762                               \string\textcurrency\MessageBreak
763   \space\space 4 = 5 + \string\texteuro\MessageBreak
764   \space\space 3 = 4 + \string\textohm\MessageBreak
765   \space\space 2 = 3 + \noexpand\textestimated+
766                               \string\textcurrency\MessageBreak
767   \space\space 1 = TS1 - \noexpand\textcircled-
768                               \string\t\MessageBreak
769   \space\space 0 = TS1 (full)\MessageBreak
770   Font families with sub-encoding setting implement\MessageBreak
771   only a restricted character set as indicated.\MessageBreak
772   Family '?' is the default used for unknown fonts.\MessageBreak
773   See the documentation for details\@gobble}
```

\DeclareEncodingSubset An encoding subset to which a font family belongs is declared by the command `\DeclareEncodingSubset` that takes the major encoding as the first argument (e.g., TS1), the family name as the second argument (e.g., `cmr`), and the subset encoding id as a third, (e.g., 0 for `cmr`).

The default encoding subset to use when nothing is known about the current font family is named `?`.

```
774 \def\DeclareEncodingSubset#1#2#3{%
775   \@ifundefined{#1:#2}%
776     {\PackageInfo{textcomp}{Setting #2 sub-encoding to #1/#3}}%
777     {\PackageInfo{textcomp}{Changing #2 sub-encoding to #1/#3}}%
778   \@namedef{#1:#2}{#3}}
779 \onlypreamble\DeclareEncodingSubset
```

The options for the package are the following:

safe for unknown font families enables only symbols that are also in the ISO-Adobe character set; without "currency", which is often misused for the Euro. Older Type1 fonts from the non-TeX world provide only this subset.

euro enables the “safe” symbols plus the `\texteuro` command. Most newer fonts provide this.

full enables all TS1 commands; useful only with fonts like EC or CM bright.

almostfull same as “full”, except that `\textcircled` and `\t` are *not* redefined from their defaults to avoid that commands like `\copyright` suddenly no longer work.

force ignore all subset encoding definitions stored in the package itself or in the configuration file and always use the default subset as specified by one of the other options (seldom useful, only dangerous).

`\iftc@forced` Switch used to implement the **force** option

```
780 \newif\iftc@forced \tc@forcedfalse
```

This is implemented by defining the default subset:

```
781 \DeclareOption{full}{\DeclareEncodingSubset{TS1}{?}{0}}
782 \DeclareOption{almostfull}{\DeclareEncodingSubset{TS1}{?}{1}}
783 \DeclareOption{euro}{\DeclareEncodingSubset{TS1}{?}{4}}
784 \DeclareOption{safe}{\DeclareEncodingSubset{TS1}{?}{5}}
```

The default is “almostfull” which means that old documents will work except that `\textcircled` and `\t` will use the kernel defaults (with the advantage that this also works if the current font (as often the case) doesn’t implement these glyphs.

The “force” option simply sets the switch to true.

```
785 \DeclareOption{force}{\tc@forcedtrue}
```

The suggestions to user is to use the “safe” option always unless that balks in which case they could switch to “almostfull” but then better check their output manually.

```
786 \def\tc@errorwarn{\PackageError}
787 \DeclareOption{warn}{\gdef\tc@errorwarn#1#2#3{\PackageWarning{#1}{#2}}}
788 \DeclareOption{quiet}{\gdef\tc@errorwarn#1#2#3{}}
789 \ExecuteOptions{almostfull}
790 \ProcessOptions\relax
```

`\CheckEncodingSubset` The command `\CheckEncodingSubset` will check if the current font family has the right encoding subset to typeset a certain command. It takes five arguments as follows: first argument is either `\UseTextSymbol`, `\UseTextAccent` depending on whether or not the symbol is a text symbol or a text accent.

The second argument is the encoding from which this symbol should be fetched.

The third argument is either a fake accessor command or an error message. the code in that argument (if ever executed) receives two arguments: **#2** and **#5** of `\CheckEncodingSubset`.

Argument four is the subset encoding id to test against: if this value is higher than the subset id of the current font family then we typeset the symbol, i.e., execute **#1{#2}#5** otherwise it runs **#3#5**, e.g., to produce an error message or fake the glyph somehow.

Argument five is the symbol or accent command that is being checked.

For usage examples see definitions below.

```
791 \iftc@forced
```

If the “force” option was given we always use the default for testing against.

```

792 \def\CheckEncodingSubset#1#2#3#4#5{%
793   \ifnum #4>%
794     0\csname #2:\endcsname
795     \relax
796   \expandafter\@firstoftwo
797   \else
798   \expandafter\@secondoftwo
799   \fi
800   {#1{#2}}{#3}%
801   #5%
802 }

```

In normal circumstances the test is a bit more complicated: first check if there exists a macro $\langle arg2 \rangle : \langle current-family \rangle$ and if so use that value to test against, otherwise use the default to test against.

```

803 \else
804 \def\CheckEncodingSubset#1#2#3#4#5{%
805   \ifnum #4>%
806     \expandafter\ifx\csname #2:\f@family\endcsname\relax
807     0\csname #2:\endcsname
808     \else
809     \csname #2:\f@family\endcsname
810     \fi
811     \relax
812   \expandafter\@firstoftwo
813   \else
814   \expandafter\@secondoftwo
815   \fi
816   {#1{#2}}{#3}%
817   #5%
818 }
819 \fi

```

$\backslash tc@subst$

```

820 \def\tc@subst#1{%
821   \tc@errorwarn{textcomp}%
822   {Symbol \string#1 not provided by\MessageBreak
823     font family \f@family\space
824     in TS1 encoding.\MessageBreak Default family used instead}\@eha
825   \bgroup\fontfamily\textcompsubstdefault\selectfont#1\egroup
826 }

```

$\backslash tc@error$ $\backslash tc@error$ is going to be used in arg #3 of $\backslash CheckEncodingSubset$ when a symbol is not available in a certain font family. It gets pass the encoding it normally lives in (arg one) and the name of the symbol or accent that has a problem.

```

827 % error commands take argument:
828 % #1 symbol to be used
829 \def\tc@error#1{%
830   \PackageError{textcomp}% % should be latex error if general
831   {Accent \string#1 not provided by\MessageBreak
832     font family \f@family\space
833     in TS1 encoding}\@eha
834 }

```

`\tc@fake@euro` `\tc@fake@euro` is an example of a “fake” definition to use in arg #3 of `\CheckEncodingSubset` when a symbol is not available in a certain font family. Here we produce an Euro symbol by combining a “C” with a “=”.

```

835 \def\tc@fake@euro#1{%
836   \leavevmode
837   \PackageInfo{textcomp}{Faking \noexpand#1 for font family
838               \f@family\MessageBreak in TS1 encoding}%
839   \valign{##\cr
840     \vfil\hbox to 0.07em{\dimen@\f@size\p@
841                       \math@fontsfalse
842                       \fontsize{.7\dimen@}\z@\selectfont=\hss}%
843     \vfil\cr%
844     \hbox{C}\crrcr
845   }%
846 }
```

`\tc@check@symbol` These are two abbreviations that we use below to check symbols and accents in
`\tc@check@accent` TS1. Only there to save some space, e.g., we can then write

```
\DeclareTextCommandDefault{\textcurrency}{\tc@check@symbol3\textcurrency}
```

to ensure that `\textcurrency` is only typeset if the current font has a TS1 subset id of less than 3. Otherwise `\tc@error` is called telling the user that for this font family `\textcurrency` is not available.

```

847 \def\tc@check@symbol{\CheckEncodingSubset\UseTextSymbol{TS1}\tc@subst}
848 \def\tc@check@accent{\CheckEncodingSubset\UseTextAccent{TS1}\tc@error}
```

We start with the commands that are “safe” and which can be unconditionally set up, first the accents...

```

849 \DeclareTextAccentDefault{\capitalcedilla}{TS1}
850 \DeclareTextAccentDefault{\capitalogonek}{TS1}
851 \DeclareTextAccentDefault{\capitalgrave}{TS1}
852 \DeclareTextAccentDefault{\capitalacute}{TS1}
853 \DeclareTextAccentDefault{\capitalcircumflex}{TS1}
854 \DeclareTextAccentDefault{\capitaltilde}{TS1}
855 \DeclareTextAccentDefault{\capitaldieresis}{TS1}
856 \DeclareTextAccentDefault{\capitalhungarumlaut}{TS1}
857 \DeclareTextAccentDefault{\capitalring}{TS1}
858 \DeclareTextAccentDefault{\capitalcaron}{TS1}
859 \DeclareTextAccentDefault{\capitalbreve}{TS1}
860 \DeclareTextAccentDefault{\capitalmacron}{TS1}
861 \DeclareTextAccentDefault{\capitaldotaccent}{TS1}
```

...and then the other glyphs.

```

```

The `\textcircled` and `\t` are handled specially, unless the current font has a subset id of 0 (i.e. full TS1) we pick the symbols up from the math font encodings, i.e., the third argument to `\CheckEncodingSubset` uses `\UseTextAccent` to get them from there.

```

1032 \DeclareTextCommandDefault{\textcircled}
1033   {\CheckEncodingSubset\UseTextAccent{TS1}%
1034     {\UseTextAccent{OMS}}1\textcircled}
1035 \DeclareTextCommandDefault{\t}
1036   {\CheckEncodingSubset\UseTextAccent{TS1}%
1037     {\UseTextAccent{OML}}1\t}

```

Finally input the encoding-specific definitions for TS1 thus making the top-level definitions optimised for this encoding (and not for the default encoding).

```

1038 \input{ts1enc.def}

```

Now having the new glyphs available we also want to make sure that they are used. For most cases this will automatically happen but for some glyphs there are inferior definitions already known to L^AT_EX which will prevent the usage of the TS1 versions. So we better get rid of them:

```

1039 \UndeclareTextCommand{\textsterling}{OT1}
1040 \UndeclareTextCommand{\textdollar} {OT1}

```

Similar declarations should probably be made for other encodings like OT4 if they are in use.

```

1041 %\UndeclareTextCommand{\textsterling}{OT4}
1042 %\UndeclareTextCommand{\textdollar} {OT4}

```

From the T1 encoding there are two candidates for removal: `%0` and `%00` since these are both constructed from `%` followed by a tiny ‘o’ rather than being a single glyph. The problem with this approach is that in PostScript fonts this small zero is usually not available resulting in `%■` rather than `%0` while the real glyph (at least for `\textperthousand`) is available in the PostScript version of TS1. So for the moment we compromise by removing the T1 declaration for `\textperthousand` but keeping the one for `\textpertenthousand`. This will have the effect that with Computer Modern fonts everything will come out (although `%0` and `%00` are not taken from the same physical font) and with PostScript fonts `%0` will come out correctly while `%00` will most likely look like `%■` — which is probably an improvement over just getting a single ‘■’ to indicate a completely missing glyph, which would happen if we also ‘undeclared’ `\textpertenthousand`.

```

1043 \UndeclareTextCommand{\textperthousand}{T1}
1044 %\UndeclareTextCommand{\textpertenthousand}{T1}

```

60.1.1 Supporting oldstyle digits

```

1045 \DeclareRobustCommand\oldstylenums[1]{%
1046   \begingroup
1047   \ifmmode
1048     \mathgroup\symletters #1%
1049   \else
1050     \CheckEncodingSubset\@use@text@encoding{TS1}%
1051     {\PackageWarning{textcomp}%
1052       {Oldstyle digits unavailable for
1053        family \f@family.\MessageBreak
1054         Lining digits used instead}}%
1055     \tw@{#1}%
1056   \fi
1057 \endgroup
1058 }

```

60.1.2 Subset encoding defaults

For many font families commonly used in the T_EX world we provide the subset encoding data here. Users can add additional font families in the file `textcomp.cfg` if they own other fonts.

However, if the option “forced” was given then all subset encoding specifications are ignored, so there is no point in setting any of them up:

```

1059 \iftc@forced \else

```

Computer modern based fonts (e.g., CM, CM-Bright, Concrete):

```

1060 \DeclareEncodingSubset{TS1}{cmr}      {0}
1061 \DeclareEncodingSubset{TS1}{cmss}     {0}
1062 \DeclareEncodingSubset{TS1}{cmtt}     {0}
1063 \DeclareEncodingSubset{TS1}{cmvtt}    {0}
1064 \DeclareEncodingSubset{TS1}{cmbr}     {0}
1065 \DeclareEncodingSubset{TS1}{cmtl}     {0}
1066 \DeclareEncodingSubset{TS1}{ccr}      {0}

```

PSNFSS fonts:

```

1067 \DeclareEncodingSubset{TS1}{ptm}      {4}
1068 \DeclareEncodingSubset{TS1}{pcr}      {4}
1069 \DeclareEncodingSubset{TS1}{phv}      {4}
1070 \DeclareEncodingSubset{TS1}{ppl}      {3}
1071 \DeclareEncodingSubset{TS1}{pag}      {4}
1072 \DeclareEncodingSubset{TS1}{pbk}      {4}
1073 \DeclareEncodingSubset{TS1}{pnc}      {4}
1074 \DeclareEncodingSubset{TS1}{pzc}      {4}
1075 \DeclareEncodingSubset{TS1}{bch}      {4}
1076 \DeclareEncodingSubset{TS1}{put}      {5}

```

Other CTAN fonts (probably not complete):

```

1077 \DeclareEncodingSubset{TS1}{uag}      {5}
1078 \DeclareEncodingSubset{TS1}{ugq}      {5}
1079 \DeclareEncodingSubset{TS1}{ul8}      {4}
1080 \DeclareEncodingSubset{TS1}{ul9}      {4} % (LuxiSans, one day)
1081 \DeclareEncodingSubset{TS1}{augie}     {5}
1082 \DeclareEncodingSubset{TS1}{dayrom}    {3}
1083 \DeclareEncodingSubset{TS1}{dayroms}   {3}
1084 \DeclareEncodingSubset{TS1}{pxr}      {0}

```

```

1085 \DeclareEncodingSubset{TS1}{pxss}    {0}
1086 \DeclareEncodingSubset{TS1}{pxtt}    {0}
1087 \DeclareEncodingSubset{TS1}{txr}      {0}
1088 \DeclareEncodingSubset{TS1}{txss}     {0}
1089 \DeclareEncodingSubset{TS1}{txtt}     {0}

```

Latin Modern and TeX Gyre:

```

1090 \DeclareEncodingSubset{TS1}{lmr}      {0}
1091 \DeclareEncodingSubset{TS1}{lmdh}      {0}
1092 \DeclareEncodingSubset{TS1}{lmss}      {0}
1093 \DeclareEncodingSubset{TS1}{lmssq}     {0}
1094 \DeclareEncodingSubset{TS1}{lmvtt}     {0}
1095 \DeclareEncodingSubset{TS1}{lmtt}      {0}

1096 \DeclareEncodingSubset{TS1}{qhv}      {0}
1097 \DeclareEncodingSubset{TS1}{qag}      {0}
1098 \DeclareEncodingSubset{TS1}{qbk}      {0}
1099 \DeclareEncodingSubset{TS1}{qcr}      {0}
1100 \DeclareEncodingSubset{TS1}{qcs}      {0}
1101 \DeclareEncodingSubset{TS1}{qpl}      {0}
1102 \DeclareEncodingSubset{TS1}{qtm}      {0}
1103 \DeclareEncodingSubset{TS1}{qzc}      {0}
1104 \DeclareEncodingSubset{TS1}{qhvc}     {0}

```

Fourier-GUTenberg:

```

1105 \DeclareEncodingSubset{TS1}{futs}     {4}
1106 \DeclareEncodingSubset{TS1}{futex}    {4}
1107 \DeclareEncodingSubset{TS1}{futj}     {4}

```

Y&Y's Lucida Bright

```

1108 \DeclareEncodingSubset{TS1}{hlh}      {3}
1109 \DeclareEncodingSubset{TS1}{hls}      {3}
1110 \DeclareEncodingSubset{TS1}{hlst}     {3}

```

The remaining settings for Lucida are conservative: the following fonts contain the `\textohm` character but not the `\texteuro`, i.e., belong to neither subset 4 nor subset 3. If you want to use the `\textohm` with these fonts copy these definition to `textcomp.cfg` and change the subset to 3. However in that case make sure that you do not use the `\texteuro`.

```

1111 \DeclareEncodingSubset{TS1}{hlct}     {5}
1112 \DeclareEncodingSubset{TS1}{hlx}      {5}
1113 \DeclareEncodingSubset{TS1}{hlce}     {5}
1114 \DeclareEncodingSubset{TS1}{hlcn}     {5}
1115 \DeclareEncodingSubset{TS1}{hlcw}     {5}
1116 \DeclareEncodingSubset{TS1}{hlcf}     {5}

```

Other commercial families...

```

1117 \DeclareEncodingSubset{TS1}{pplx}     {3}
1118 \DeclareEncodingSubset{TS1}{pplj}     {3}
1119 \DeclareEncodingSubset{TS1}{ptmx}     {4}
1120 \DeclareEncodingSubset{TS1}{ptmj}     {4}

```

If the file `textcomp.cfg` exists it will be loaded at this point. This allows to define further subset encodings for font families not covered by default.

```

1121 \InputIfFileExists{textcomp.cfg}
1122 {\PackageInfo{textcomp}{Local configuration file used}}{}

```

1123 \fi

1124 </TS1oldsty>

File y

ltpageno.dtx

61 Page Numbering

Page numbers are produced by a page counter, used just like any other counter. The only difference is that `\c@page` contains the number of the next page to be output (the one currently being produced), rather than one minus it. Thus, it is normally initialized to 1 rather than 0. `\c@page` is defined to be `\count0`, rather than a count assigned by `\newcount`.

`\pagenumbering` The user sets the pagenumber style with the `\pagenumbering{<foo>}` command, which sets the page counter to 1 and defines `\thepage` to be `\foo`. For example, `\pagenumbering{roman}` causes pages to be numbered i, ii, etc.

```
1 <*2kernel>
2 \message{page nos.,}

3 \countdef\c@page=0 \c@page=1
4 \def\c1@page{}
5 \def\pagenumbering#1{%
6   \global\c@page \@ne \gdef\thepage{\csname @#1\endcsname
7     \c@page}}
8 </2kernel>
```

File z

ltxref.dtx

62 Cross Referencing

The user writes `\label{foo}` to define the following cross-references:

`\ref{foo}`: value of most recently incremented referencable counter. in the current environment. (Chapter, section, theorem and enumeration counters are referencable, footnote counters are not.)

`\pageref{foo}`: page number at which `\label{foo}` command appeared. where foo can be any string of characters not containing ‘\’, ‘{’ or ‘}’.

Note: The scope of the `\label` command is delimited by environments, so `\begin{theorem} \label{foo} ... \end{theorem} \label{bar}` defines `\ref{foo}` to be the theorem number and `\ref{bar}` to be the current section number.

Note: `\label` does the right thing in terms of spacing – i.e., leaving a space on both sides of it is equivalent to leaving a space on either side.

62.1 Cross Referencing

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

```
1 (*2ekernel)
2 \message{x-ref,}
```

This is implemented as follows. A referencable counter CNT is incremented by the command `\refstepcounter{CNT}`, which sets `@currentlabel == {CNT}{eval(\p@cnt\theCNT)}`. The command `\label{FOO}` then writes the following on file `\@auxout`:

```
\newlabel{FOO}{eval(\@currentlabel){eval(\thepage)}}
```

```
\ref{FOO} ==
BEGIN
  if \r@foo undefined
  then @refundundefined := G T
    ??
    Warning: 'reference foo on page ... undefined'
  else \@car \eval(\r@FOO)\@nil
  fi
END
```

```
\pageref{foo} =
BEGIN
  if \r@foo undefined
  then @refundundefined := G T
    ??
    Warning: 'reference foo on page ... undefined'
  else \@cdr \eval(\r@FOO)\@nil
  fi
END
```

End of historical L^AT_EX 2.09 comments.

`\labelformat` A reference via `\ref` produces by default the data associated with the corresponding `\label` command (typically a number); any additional formatting has to be provided by the user. If, for example, references to equations are always to be typeset as “equation (*number*)”, one has to code “`equation (\ref{key})`”. With `\labelformat` there is a possibility to generate such frills automatically without resorting to low-level coding. The command takes two arguments: the first is the name of a counter and the second is its representation when referenced. This means that for a successful usage, one has to know the counter name being used for generating the label, though in practice this should not pose a problem. The current counter number is picked up as an argument. Here are two examples:

```
\labelformat{section}{section~#1}
\labelformat{equation}{equation~(#1)}
```

`\Ref` A side effect of using `\labelformat` is that, depending on the defined formatting, it becomes impossible to use `\ref` at the beginning of a sentence (if its replacement text starts with a lowercase letter). To overcome this problem we introduce the command `\Ref` that behave like `\ref` except that it uppercases the first token of the generated string.

To make `\Ref` work properly the very first token in the second argument of `\labelformat` has to be a simple ASCII or UTF-8 letter, otherwise the capitalization will fail or worse, you will end up with some error messages. If you actually need something more complicated in this place (e.g., an accented letter not written as a UTF-8 character) you have to explicitly surround it with braces, to identify the part that needs to be capitalized. For example, for figure references in the Hungarian language you might want to write `\labelformat{figure}{\a'bra~\thefigure}` or use `\labelformat{figure}{ábra~\thefigure}` which avoids the brace problem.

`\G@refundefinedtrue` This does not save on name-space (since `\G@refundefinedfalse` was never needed) but it does make the implementation of such one-way switches more consistent. The extra macro to make the change is used since this change appears several times.

`\@refundefined`

Note despite its name, `\G@refundefinedtrue` does *not* correspond to an `\if` command, and there is no matching `...false`. It would be more natural to call the command `\G@refundefined` (as inspection of the change log will reveal) but unfortunately such a change would break any package that had defined a `\ref`-like command that mimicked the definition of `\ref`, calling `\G@refundefinedtrue`. Inspection of the T_EX archives revealed several such packages, and so this command has been named `...true` so that the definition of `\ref` need not be changed, and the packages will work without change.

```
3 % \newif\ifG@refundefined
4 % \def\G@refundefinedtrue{\global\let\ifG@refundefined\iftrue}
5 % \def\G@refundefinedfalse{\global\let\ifG@refundefined\iffalse}
6 \def\G@refundefinedtrue{%
7   \gdef\@refundefined{%
8     \@latex@warning@no@line{There were undefined references}}
9 \let\@refundefined\relax
```

`\ref` Referencing a `\label`. RmS 91/10/25: added a few extra `\reset@font`, as suggested by Bernd Raichle
`\pageref`
`\setref` RmS 92/08/14: made `\ref` and `\pageref` robust
RmS 93/09/08: Added setting of redefined switch.

```

10 \def\@setref#1#2#3{%

```

`\newlabel` This command will be written to the `.aux` file to pass label information from one run to another.

`\@newl@bel` The internal form of `\newlabel` and `\bibcite`. Note that this macro does its work inside a group. That way the local assignments it needs to do don't clutter the save stack. This prevents large documents with many labels to run out of save stack.

```

22 \def\@newl@bel#1#2#3{%
23   \@ifundefined{#1#2}%
24     \relax
25     {\gdef \@multiplelabels {%
26       \@latex@warning@no@line{There were multiply-defined labels}}%
27       \@latex@warning@no@line{Label ‘#2’ multiply defined}}%
28   \global\@namedef{#1#2}{#3}}
29 \def\newlabel{\@newl@bel r}
30 \@onlypreamble\@newl@bel
```

`\if@multiplelabels` This is redefined to produce a warning if at least one label is defined more than once. It is executed by the `\enddocument` command.

```

31 \let \@multiplelabels \relax
```

`\label` The commands `\label` and `\refstepcounter` have been changed to allow `\protect`'ed commands to work properly. For example,

```
\def\thechapter{\protect\foo{\arabic{chapter}.\roman{section}}}
```

will cause a `\label{bar}` command to define `\ref{bar}` to expand to something like `\foo{4.d}`. Change made 20 Jul 88.

```

32 \def\label#1{\@bsphack
33   \protected@write\@auxout{%
34     {\string\newlabel{#1}{\@currentlabel}\thepage}}%
35   \@esphack}

36 \if2kernel
37 \if*2kernel\iflatexrelease
38 \iflatexrelease\IncludeInRelease{2019/10/01}%
39 \iflatexrelease      {\refstepcounter}{Add \labelformat and \Ref}%
```

`\refstepcounter` Step the counter and allow for labels to point to its current value.

```
40 \def\refstepcounter#1{\stepcounter{#1}%  
41   \protected@edef\@currentlabel
```

By generating the second `csname` first the `\p@...` command can grab it as an argument which can be helpful for more complicated typesetting arrangements.

The trick is to ensure that `\csname the#1\endcsname` is turned into a single token before `\p@...` is expanded further. This way, if the `\p@...` command is a macro with one argument it will receive `\the...`. With the original kernel code (i.e., without the `\expandafter`) it will instead pick up `\csname` which would be disastrous.

Using `\expandafter` instead of braces delimiting the argument is better because, assuming that the `\p@...` command is not defined as a macro with one argument, the braces will stay and prohibit kerning that might otherwise happen between the glyphs generated by `\the...` and surrounding glyphs.

```
42   {\csname p@#1\expandafter\endcsname\csname the#1\endcsname}%  
43 }
```

`\labelformat` A shortcut to set the `\p@...` macro for a counter. It will pick up the counter representation as an argument so that it can be specially formatted.

```
44 \def\labelformat#1{\expandafter\def\csname p@#1\endcsname##1}
```

`\Ref` This macro expands the result of `\ref` and then uppercases the first token. Only useful if the label was generated via `\labelformat` and contains some lower case letter at its start. If the label starts with a complicated construct (e.g., an accented letter that is provided via a command, e.g., `\"a` instead of a UTF-8 character like ä) one has to surround everything that needs uppercasing in a brace group in the definition of `\labelformat`.¹⁰

```
45 \DeclareRobustCommand\Ref[1]{\protected@edef\@tempa{\ref{#1}}%  
46   \expandafter\MakeUppercase\@tempa}  
  
47 \if2ekernel\latexrelease  
48 \if\latexrelease\EndIncludeInRelease  
49 \if\latexrelease\IncludeInRelease{0000/00/00}%

ltmiscen.dtx

63 Miscellaneous Environments

This section implements the basic environment mechanism, and also a few specific environments including `document`, The math environments and related commands, the ‘flushing’ environments, (`center`, `flushleft`, `flushright`), and `verbatim`.

```
1 (*2kernel)
2 \message{environments,}
```

63.1 Environments

`\begin{foo}` and `\end{foo}` are used to delimit environment `foo`.

`\begin{foo}` starts a group and calls `\foo` if it is defined, otherwise it does nothing.

`\end{foo}` checks to see that it matches the corresponding `\begin` and if so, it calls `\endfoo` and does an `\endgroup`. Otherwise, `\end{foo}` does nothing.

If `\end{foo}` needs to ignore blanks after it, then `\endfoo` should globally set the `@ignore` switch true with `\@ignoretrue` (this will automatically be global).

NOTE: `\@@end` is defined to be the `\end` command of $\mathrm{T}_{\mathrm{E}}\mathrm{X}82$.

`\enddocument` is the user’s command for ending the manuscript file.

`\stop` is a panic button — to end $\mathrm{T}_{\mathrm{E}}\mathrm{X}$ in the middle.

```

Reading data from auxiliary files (like `.toc` normally happens in vertical mode and it therefore doesn't matter if line endings are converted to spaces by `TeX` during that process.

However, especially the `.toc` file might be read in L-R mode (in cases the `\tableofcontents` attempts to put, say a list of sub-sections as a paragraph. In that case the newlines after a line like

```
\contentsline {subsubsection}{\numberline {1.1.1}A C-head}{2}
```

might result in spurious spaces (e.g., when that level is not included).

That could be fixed by reading in the file using `\endlinechar=-1` but that has the danger that it drops some valid endlines that should be converted to spaces (for example when the user edited the TOC and then used `\nofiles` to preserve it.

So the approach taken instead is this:

- `\addcontentsline` adds the command `\protected@file@percent` to the end of the second argument of `\@writefile` that is written to the `.aux`. As the name indicates this is a protected macro so it doesn't change if it is written out.
- When the `.aux` is read back in at the end of the run, `\@writefile` is executed and writes its second argument unmodified to the file with the extension given by its first argument. Or rather that was how it was in the past.
- Instead we change `\@writefile` slightly: basically it looks at the second argument and if the last token in there is `\protected@file@percent` then it is replaced by a percent character and that is then written out. If not (for example, if the data came from a user issued `\addtocontents`, or from some package that uses `\@writefile` for writing its own files) then the command behaves exactly as before.

`\protected@file@percent` Dummy cs to be replaced by a percent sign inside `\@writefile`. If it survives (when used incorrectly) it will expand to nothing in a typesetting context.

```
43 \<2kernel>
44 (*2kernel | latexrelease)
45 (latexrelease)\IncludeInRelease{2018/12/01}%
46 (latexrelease)          {\protected@file@percent}{Mask line endings}%
47 \protected\def\protected@file@percent{}
```

`\add@percent@to@temptokena` Helper function which is used to inspect a sequence of tokens (the second argument of `\@writefile` and if the last token is `\protected@file@percent` it will replace it by a harmless percent. The result is saved in `\@temptokena` for later use.

```
48 \catcode'\^^A=9
49 \long\gdef\add@percent@to@temptokena
50   #1\protected@file@percent#2\add@percent@to@temptokena
```

When we call this macro in `\@writefile` we stick in `\@empty` at the beginning, so that in case the tokenlist consists of a single brace group the braces aren't stripped. The `\expandafter` then expands this extra token away again.

```
51   {\expandafter\ifx\expandafter X\detokenize{#2}X\expandafter\dontadd@percent@to@temptokena
52     \expandafter\doadd@percent@to@temptokena\fi{#1}}
```

```

53 \long\def\dont@add@percent@to@temptokena#1{%
54   \@temptokena\expandafter{#1}}

```

`latexrelease` will read this code in high-speed mode in certain situations. During that it will only look for `\if` tests but not actually execute the `\catcode` change above. As a result it will drop anything after the `%` character in the definition. Therefore the `\fi` needs to be on the next line and we need locally another comment character to avoid getting spaces into the definition—a weird problem :-)

```

55 \begingroup
56 \catcode'\%=12
57 \catcode'\^^A=14

100 \begingroup\@endpfalse\reserved@a}

```

A version that doesn't start out with `\relax` when in typesetting mode would be the following, but since `\begin` issues a `\begingroup` it wouldn't help much with respect to allowing things like `\noalign` or `\multicolumn` inside.

```

101 %\edef\begin
102 %  {\unexpanded{%
103 %    \ifx\protect\@typeset@protect
104 %      \expandafter\@gobble
105 %    \fi
106 %    \protect
107 %  }}%
108 %  \expandafter\noexpand\csname begin \endcsname
109 %  }
110 %\@namedef{begin }#1{%
111 %  \ifundefined{#1}%
112 %    {\def\reserved@a{\@latex@error{Environment #1 undefined}\@eha}}%
113 %    {\def\reserved@a{\def\@currentvir{#1}%
114 %      \edef\@currentvline{\on@line}%
115 %      \csname #1\endcsname}}%
116 %  \ignorefalse
117 %  \begingroup\@endpfalse\reserved@a}

```

`\end` While `\begin` was made robust simply by using `\DeclareRobustCommand` we need to be a bit more subtle with `\end` as there are packages out there that try to look into the top-level contents of `\end{foo}` (that is at the expansion of `\endfoo`) to see if it contains certain macros. This is done by hitting `\end{foo}` with three `\expandafters`, the first to get

```
\csname endfoo\endcsname \checkend{foo}% etc.
```

the second to expand the `\csname`, i.e., to get to

```
\endfoo \checkend{foo}% etc.
```

and the third to finally get to the top-level content of `\endfoo`, i.e.

```
<top-level content of \endfoo> \checkend{foo}% etc.
```

Therefore a robust replacement should produce the same results after three expansions (there first is obviously different).

Basically the definition of `\end` should either produce `\protect\end␣` (when not doing typesetting) or it should produce `\end␣` (without the `\protect`) when doing typesetting. Furthermore, it should (when in typesetting mode) show exactly the same result as `\end␣` (which is the original fragile definition of `\end`) when you expand either of them twice, i.e.,

```
\endfoo \checkend{foo}% etc.
```

That is achieved with the code below (which is worth studying carefully).

There is some trickery involved here: in particular we use `\romannumeral` to change a single expansion into three successive expansions in one go. That primitive expands until it has scanned a number (0 in this case, so it doesn't produce any output) and so it allows us to place arbitrary many `\expandafters` inside that are all going to be executed when `\romannumeral` is hit by a single `\expandafter`.

```

118 \edef\end
119   {\unexpanded{%
120     \romannumeral
121     \ifx\protect\@typeset@protect
122       \expandafter      %1
123       \expandafter      %2
124       \expandafter      %1
125       \expandafter      %3 expands the \csname inside \end<space>
126       \expandafter      %1
127       \expandafter      %2 expands \end<space>
128       \expandafter      %1 expands the \else
129       \z@
130     \else
131       \expandafter\z@\expandafter\protect
132     \fi
133   }%
134   \expandafter\noexpand\csname end \endcsname
135 }

```

And here is the original definition of `\end` the way it was in \LaTeX for several decades now hidden in `\end_`.

```

136 \@namedef{end }#1{%
137   \csname end#1\endcsname\@checkend{#1}%
138   \expandafter\endgroup\if@endpe\@doendpe\fi
139   \if@ignore\@ignorefalse\ignorespaces\fi}
140 </2ekernel | latexrelease>
141 <latexrelease>\EndIncludeInRelease

```

And here the rollback in case that is ever needed.

```

142 <latexrelease>\IncludeInRelease{0000/00/00}%
143 <latexrelease>          {\begin}{Making \begin/\end robust}%
144 <latexrelease>\kernel@make@fragile\begin
145 <latexrelease>\kernel@make@fragile\end
146 <latexrelease>
147 <latexrelease>\EndIncludeInRelease
148 <*2ekernel>

```

`\@checkend`

```

149 \def\@checkend#1{\def\reserved@a{#1}\ifx
150   \reserved@a\@currenvir \else\@badend{#1}\fi}

```

`\@currenvline` We do need a default value for `\@currenvline` on top-level since the document environment cancels the brace group. This means that a mismatch with `\begin{document}` will not produce a line number. Thus the outer default must be `\@empty` or we will end up with two spaces.

```

151 \let\@currenvline\@empty

```

63.2 Center, Flushright, Flushleft

```
152 \message{center,}
```

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

```
\center, \flushright and \flushleft set
  \rightskip = 0pt or \@flushglue (as appropriate)
  \leftskip  = 0pt or \@flushglue (as appropriate)
  \parindent = 0pt
  \parfillskip = 0pt. (except \flushleft)
  \\\          == \par \vskip -\parskip
  \|[LENGTH] == \\\ \vskip LENGTH
  \\\*         == \par \penalty 10000 \vskip -\parskip
  \\\*[LEN]    == \\\* \vskip LENGTH
```

They invoke the `trivlist` environment to handle vertical spacing before and after them.

`\centering`, `\raggedright` and `\raggedleft` are the declaration analogs of the above.

`\raggedright` has a more universal effect, however. It sets `\@rightskip := flushglue`. Every environment, like the list environments, that set `\rightskip` to its 'normal' value set it to `\@rightskip`

End of historical L^AT_EX 2.09 comments.

63.3 Verbatim

206 \message{verbatim,}

The verbatim environment uses the fixed-width `\ttfamily` font, turns blanks into spaces, starts a new line for each carriage return (or sequence of consecutive carriage returns), and interprets *every* character literally. I.e., all special characters `\`, `{`, `$`, etc. are `\catcode`'d to 'other'.

The command `\verb` produces in-line verbatim text, where the argument is delimited by any pair of characters. E.g., `\verb #...#` takes '...' as its argument, and sets it verbatim in `\ttfamily` font.

The *-variants of these commands are the same, except that spaces print as the TeXbook's space character instead of as blank spaces.

\@vobeyspaces

207 {\catcode'\ =\active%

208 \gdef\@vobeyspaces{\catcode'\ \active\let \@xobeysp}}

\@xobeysp

\@xverbatim

\@sxverbatim

```

263 /2kernel)
264 (*2kernel | latexrelease>
265 (latexrelease)\IncludeInRelease{2018/12/01}%
266 (latexrelease) {\verbvisiblespace}{Setup visible space for verb}%

```

`\asciispace` The character in slot 32, in typewriter fonts (historically) a visible space but in other fonts a real space or something else

```

267 \DeclareRobustCommand\asciispace{\char 32 }

```

`\verbvisiblespace` This defines how to get a visible space in `\verb*` and friends. In classic T_EX this is just the slot 32, but in TU encoded fonts we switch fonts and take the character from cmtt.

```

268 \ifx\Umathcode\@undefined
269   \let\verbvisiblespace\asciispace % Pdftex version
270 \else
271   \DeclareRobustCommand\verbvisiblespace
272     {\leavevmode{\usefont{OT1}{cmtt}{m}{n}\asciispace}} % xetex/luatex version
273 \fi

```

`\@setupverbvisiblespace` In pdf \TeX a catcode 12 space will produce the character in slot 32 which is assumed to be a visible space character (in a typewriter font in OT1 or T1 encoding). In Xe \TeX or Lua \TeX a font in TU encoding is normally used and that has a real space in this slot. So what we do in this case is this: we check the definition of `\verbvisiblespace` and if it is `\asciispace` we assume that the char32 can be used (e.g., in pdf \TeX). We then redefine `\@xobeysp` so that after running `\@vobeyspaces` we get characters from slot 32 for each active space.

```

274 \def\@setupverbvisiblespace{%
275   \ifx\verbvisiblespace\asciispace
276     \let\@xobeysp\asciispace
277   \else

Otherwise we measure the width of a character in the mon-spaced current font
and place a \verbvisiblespace into a box of the right width which we are then
using as the character for a space. By default this will be the space character from
OT1 cmtt but by changing \verbvisiblespace one could use, for example, the
\textvisiblespace of the current typewriter font.

278   \setbox\z@\hbox{x}%
279   \setbox\@verbvisiblespacebox\hbox to\wd\z@{\hss\verbvisiblespace\hss}%
280   \def\@xobeysp{\leavevmode\copy\@verbvisiblespacebox}%
281   \fi
282 }

```

`\@verbvisiblespacebox` The box to hold the visible space character if it isn't in slot 32 in the current typewriter font.

```

283 \newbox\@verbvisiblespacebox

```

`\@sverb` Definitions of `\@sverb` and `\@verb` changed so `\verb+foo+` does not lose leading blanks when it comes at the beginning of a line. Change made 24 May 89. Suggested by Frank Mittelbach and Rainer Schöpf.

```

284 \def\@sverb#1{%
285   \catcode'\#1\active
286   \lccode'\~'#1%
287   \gdef\verb@balance@group{\verb@egroup
288     \@latexerror{\noexpand\verb illegal in command argument}\@ehc}%
289   \aftergroup\verb@balance@group
290   \lowercase{\let~\verb@egroup}%

```

If `\@sverb` is called from `\@verb` then space is already active and supposed to produce a real space. In this case we do nothing. Otherwise we run `\@setupverbvisiblespace` to setup the right visible space char and afterwards `\@vobeyspaces` to make it the definition for the active space character.

```

291   \ifnum\catcode'\ =\active
292   \else \@setupverbvisiblespace \@vobeyspaces \fi
293 }

```

```

verbatim* For verbatim* we also set up the correct visible space character definition and
then run \@vobeyspaces. As this code is not called as part of the normal verbatim
environment (the method is done the other way around this time) we don't have
to check if space is already active—it shouldn't be.

File B

ltmath.dtx

64 Math setup

This file contains a lot of the original plain T_EX code, as well as the L^AT_EX environments for math. It still needs sorting out.

```
1 (*2kernel)
2 \message{math definitions,}
```

64.1 Math commands based on plain T_EX

64.1.1 The log-like functions

```
\log The standard operators:
3 \DeclareRobustCommand\log{\mathop{\operator@font log}\nolimits}
4 \DeclareRobustCommand\lg{\mathop{\operator@font lg}\nolimits}
5 \DeclareRobustCommand\ln{\mathop{\operator@font ln}\nolimits}
6 \DeclareRobustCommand\lim{\mathop{\operator@font lim}}
7 \DeclareRobustCommand\limsup{\mathop{\operator@font lim}\,sup}}
8 \DeclareRobustCommand\liminf{\mathop{\operator@font lim}\,inf}}
9 \DeclareRobustCommand\sin{\mathop{\operator@font sin}\nolimits}
10 \DeclareRobustCommand\arcsin{\mathop{\operator@font arcsin}\nolimits}
11 \DeclareRobustCommand\sinh{\mathop{\operator@font sinh}\nolimits}
12 \DeclareRobustCommand\cos{\mathop{\operator@font cos}\nolimits}
13 \DeclareRobustCommand\arccos{\mathop{\operator@font arccos}\nolimits}
14 \DeclareRobustCommand\cosh{\mathop{\operator@font cosh}\nolimits}
15 \DeclareRobustCommand\tan{\mathop{\operator@font tan}\nolimits}
16 \DeclareRobustCommand\arctan{\mathop{\operator@font arctan}\nolimits}
17 \DeclareRobustCommand\tanh{\mathop{\operator@font tanh}\nolimits}
18 \DeclareRobustCommand\cot{\mathop{\operator@font cot}\nolimits}
19 \DeclareRobustCommand\coth{\mathop{\operator@font coth}\nolimits}
20 \DeclareRobustCommand\sec{\mathop{\operator@font sec}\nolimits}
21 \DeclareRobustCommand\csc{\mathop{\operator@font csc}\nolimits}
22 \DeclareRobustCommand\max{\mathop{\operator@font max}}
23 \DeclareRobustCommand\min{\mathop{\operator@font min}}
24 \DeclareRobustCommand\sup{\mathop{\operator@font sup}}
25 \DeclareRobustCommand\inf{\mathop{\operator@font inf}}
26 \DeclareRobustCommand\arg{\mathop{\operator@font arg}\nolimits}
27 \DeclareRobustCommand\ker{\mathop{\operator@font ker}\nolimits}
28 \DeclareRobustCommand\dim{\mathop{\operator@font dim}\nolimits}
29 \DeclareRobustCommand\hom{\mathop{\operator@font hom}\nolimits}
30 \DeclareRobustCommand\det{\mathop{\operator@font det}}
31 \DeclareRobustCommand\exp{\mathop{\operator@font exp}\nolimits}
32 \DeclareRobustCommand\Pr{\mathop{\operator@font Pr}}
33 \DeclareRobustCommand\gcd{\mathop{\operator@font gcd}}
34 \DeclareRobustCommand\deg{\mathop{\operator@font deg}\nolimits}

\bmod And some operators have to be done by hand:
35 \DeclareRobustCommand\bmod{%
36 \nonscript\mskip-\medmuskip\mkern5mu%
```

```

37 \mathbin{\operatorname@font mod}\penalty900\mkern5mu%
38 \nonscript\mskip-\medmuskip}

\pmod
39 \DeclareRobustCommand\pmod[1]{%
40 \allowbreak\mkern18mu({\operatorname@font mod}\,\,\,#1)}

```

64.1.2 Biggggg

`\big` Variants on `\big` and friends for use with delimiters:

```

41 \DeclareRobustCommand\bigl{\mathopen\big}
42 \DeclareRobustCommand\bigm{\mathrel\big}
43 \DeclareRobustCommand\bigr{\mathclose\big}
44 \DeclareRobustCommand\Bigl{\mathopen\Big}
45 \DeclareRobustCommand\Bigm{\mathrel\Big}
46 \DeclareRobustCommand\Bigr{\mathclose\Big}
47 \DeclareRobustCommand\biggl{\mathopen\bigg}
48 \DeclareRobustCommand\biggm{\mathrel\bigg}
49 \DeclareRobustCommand\biggr{\mathclose\bigg}
50 \DeclareRobustCommand\Biggl{\mathopen\Bigg}
51 \DeclareRobustCommand\Biggm{\mathrel\Bigg}
52 \DeclareRobustCommand\Biggr{\mathclose\Bigg}

```

64.1.3 The UNSORTED Rest

The other math commands are lifted from plain T_EX.

65 List, and related environments

The generic commands for creating an indented environment – `enumerate`, `itemize`, `quote`, etc – are:

```
\list{<LABEL>}{<COMMANDS>} ... \endlist
```

which can be invoked by the user as the list environment. The LABEL argument specifies item labeling. COMMANDS contains commands for changing the horizontal and vertical spacing parameters.

Each item of the environment is begun by the command `\item[ITEMLABEL]` which produces an item labeled by ITEMLABEL. If the argument is missing, then the LABEL argument of the `\list` command is used as the item label.

The label is formed by putting `\makelabel{<ITEMLABEL>}` in an hbox whose width is either its natural width or else `\labelwidth`, whichever is larger. The `\list` command defines `\makelabel` to have the default definition:

```
\makelabel{<ARG>} == BEGIN \hfil ARG END
```

which, for a label of width less than `\labelwidth`, puts the label flushright, `\labelsep` to the left of the item's text. However, `\makelabel` can be `\let` to another command by the `\list`'s COMMANDS argument.

A `\usecounter{<foo>}` command in the second argument causes the counter `foo` to be initialized to zero, and stepped by every `\item` command without an argument. (`\label` commands within the list refer to this counter.)

When you leave a list environment, returning either to an enclosing list or normal text mode, LaTeX begins a new paragraph if and only if you leave a blank line after the `\end` command. This is accomplished by the `\@endparenv` command.

Blank lines are ignored every other reasonable place–i.e.:

- Between the `\begin{list}` and the first `\item`,
- Between the `\item` and the text of that item.
- Between the end of the last item and the `\end{list}`.

For an environment like quotation, in which items are not labeled, the entire environment is a single item. It is defined by letting `\quotation == \list{}{...}\item\relax`. (Note the `\relax`, there in case the first character in the environment is a '['.) The spacing parameters provide a great deal of flexibility in designing the format, including the ability to let the indentation of the first paragraph be different from that of the subsequent ones.

The trivlist environment is equivalent to a list environment whose second argument sets the following parameter values:

`\leftmargin = 0`: causes no indentation of left margin

`\labelwidth = 0`: see below for precise effect this has.

`\itemindent = 0:` with a null label, makes first paragraph have no indentation. Succeeding paragraphs have `\parindent` indentation. To give first paragraph same indentation, set `\itemindent = \parindent` before the `\item[]`.

Every `\item` in a trivlist environment must have an argument—in many cases, this will be the null argument (`\item[]`). The trivlist environment is mainly used for paragraphing environments, like `verbatim`, in which there is no margin change. It provides the same vertical spacing as the list environment, and works reasonably well when it occurs immediately after an `\item` command in an enclosing list.

65.1 List and Trivlist

The following variables are used inside a list environment:

`\totalleftmargin` The distance that the prevailing left margin is indented from the outermost left margin,

`\linewidth` The width of the current line. Must be initialized to `\hsize`.

`\listdepth` A count for holding current list nesting depth.

`\makelabel` A macro with a single argument, used to generate the label from the argument (given or implied) of the `\item` command. Initialized to `\@mklab` by the `\list` command. This command must produce some stretch—i.e., an `\hfil`.

`\@inlabel` A switch that is false except between the time an `\item` is encountered and the time that `TeX` actually enters horizontal mode. Should be tested by commands that can be messed up by the list environment's use of `\everypar`.

`\box\@labels` When `\@inlabel = true`, it holds the labels to be put out by `\everypar`.

`\@nparitem` A switch set by `\list` when `\@inlabel = true`. Handles the case of a `\list` being the first thing in an item.

`\@nparlist` A switch set true for a list that begins an item. No `\topsep` space is added before or after `\item`'s such a list.

`\@newlist` Set true by `\list`, set false by the first text (by `\everypar`).

`\@noitemarg` Set true when executing an `\item` with no explicit argument. Used to save space. To save time, make two separate `\@item` commands.

`\@nmbrlist` Set true by `\usecounter` command, causes list to be numbered.

`\@listctr` `\def`'ed by `\usecounter` to name of counter.

`\@noskipsec` A switch set true by a sectioning command when it is creating an in-text heading with `\everypar`.

Throughout a list environment, `\hsize` is the width of the current line, measured from the outermost left margin to the outermost right margin. Environments like `tabbing` should use `\linewidth` instead of `\hsize`.

Here are the parameters of a list that can be set by commands in the `\list's` COMMANDS argument. These parameters are all TeX skips or dimensions (defined by `\newskip` or `\newdimen`), so the usual TeX or L^AT_EX commands can be used to set them. The commands will be executed in vmode if and only if the `\list` was preceded by a `\par` (or something like an `\end{list}`), so the spacing parameters can be set according to whether the list is inside a paragraph or is its own paragraph.

65.2 Vertical Spacing (skips)

`\topsep`: Space between first item and preceding paragraph.

`\partopsep`: Extra space added to `\topsep` when environment starts a new paragraph (is called in vmode).

`\itemsep`: Space between successive items.

`\parsep`: Space between paragraphs within an item – the `\parskip` for this environment.

65.3 Penalties

`\@beginparpenalty`: put at the beginning of a list

`\@endparpenalty`: put at end of list

`\@itempenalty`: put between items.

65.4 Horizontal Spacing (dimens)

`\leftmargin`: space between left margin of enclosing environment (or of page if top level list) and left margin of this list. Must be nonnegative.

`\rightmargin`: analogous.

`\listparindent`: extra indentation at beginning of every paragraph of a list except the one started by the `\item` command. May be negative! Usually, labeled lists have `\listparindent` equal to zero.

`\itemindent`: extra indentation added right BEFORE an item label.

`\labelwidth`: nominal width of box that contains the label. If the natural width of the label \leq `\labelwidth`, then the label is flushed right inside a box of width `\labelwidth` (with an `\hfil`). Otherwise, a box of the natural width is employed, which causes an indentation of the text on that line.

`\labelsep`: space between end of label box and text of first item.

65.5 Default Values

Defaults for the list environment are set as follows. First, `\rightmargin`, `\listparindent` and `\itemindent` are set to 0pt. Then, one of the commands `\@listi`, `\@listii`, ... , `\@listvi` is called, depending upon the current level of the list. The `\@list` ... commands should be defined by the document style. A convention that the document style should follow is to set `\leftmargin` to `\leftmargini`, ..., `\leftmarginvi` for the appropriate level. Items that aren't changed may be left alone, but everything that could possibly be changed must be reset. *Historical L^AT_EX 2.09 comments (not necessarily accurate any more):*

119     \fi
120     \@endparenv
121   \fi
122 }

```

`\@endparenv` To suppress the paragraph indentation in text immediately following a paragraph-making environment, `\everypar` is changed to remove the space, and `\par` is redefined to restore `\everypar`. Instead of redefining `\par` and `\everypar`, `\@endparenv` was changed to set the `@endpe` switch, letting `\end` redefine `\par` and `\everypar`.

This allows paragraph-making environments to work right when called by other environments. (Changed 27 Oct 86)

The paragraph indent is now removed by using \setbox... since this makes \noindent a no-op here, as it should be. Thus the following comment is redundant but is left here for the sake of future historians: this next command was changed from an hskip to a kern to avoid a break point after the parindent box: the skip could cause a line-break if a very long label occurs in raggedright setting.

If \noindent was used after \item want to cancel the \itemindent skip. This case can be detected as the indentation box will be void.

```

185     {\setbox\z@\lastbox
186     \ifvoid\z@

191   \fi

```

This code is intended to prevent a page break after the first line of an item that comes immediately after a section title. It may be sensible to always forbid a page break after one line of an item? As with all such settings of `\clubpenalty` it is local so will have no effect if the item starts in a group.

Only resetting `\@nbreak` when it is true is now essential since now it is sometimes set locally.

```

65.6 Itemize and Enumerate

Enumeration is done with four counters: `enumi`, `enumii`, `enumiii` and `enumiv`, where `enumN` controls the numbering of the Nth level enumeration. The label is generated by the commands `\labelenumi` ... `\labelenumiv`, which should be defined by the document style. Note that `\p@enumN\theenumN` defines the output of a `\ref` command. A typical definition might be:

```
\def\theenumii{\alph{enumii}}
\def\p@enumii{\theenumi}
\def\labelenumii{(\theenumii)}
```

which will print the labels as ‘(a)’, ‘(b)’, ... and print a `\ref` as ‘3a’.

The item numbers are moved to the right of the label box, so they are always a distance of `\labelsep` from the item.

`\@enumdepth` holds the current enumeration nesting depth.

Itemization is controlled by four commands: `\labelitemi`, `\labelitemii`, `\labelitemiii`, and `\labelitemiv`. To cause the second-level list to be bulleted, you just define `\labelitemii` to be `•`. `\@itemspacing` and `\@itemdepth` are the analogs of `\@enumspacing` and `\@enumdepth`.

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

```
\enumerate ==
BEGIN
  if \@enumdepth > 3
    then errormessage: "Too deeply nested".
  else \@enumdepth :=L \@enumdepth + 1
    \@enumctr :=L eval(enum@\romannumeral\the\@enumdepth)

ltboxes.dtx

66 L^AT_EX Box commands

<code>\makebox</code>	<code>\makebox[⟨wid⟩][⟨pos⟩]{⟨obj⟩}</code> Puts <code>⟨obj⟩</code> in an <code>\hbox</code> of width <code>⟨wid⟩</code> , positioned by <code>⟨pos⟩</code> . The possible <code>⟨pos⟩</code> are: s stretched, l flushleft, r flushright, c (default) centred. If <code>⟨wid⟩</code> is missing, then <code>⟨pos⟩</code> is also missing and <code>⟨obj⟩</code> is put in an <code>\hbox</code> of its natural width. <code>\makebox(⟨x⟩,⟨y⟩)[⟨pos⟩]{⟨obj⟩}</code> Puts <code>⟨obj⟩</code> in an <code>\hbox</code> of width <code>x*\unitlength</code> and height <code>y*\unitlength</code> . <code>⟨pos⟩</code> arguments are s, l, r or c (default) for stretched, flushleft, flushright or centred, and t or b for top, bottom – or combinations like tr or rb. Default for horizontal and vertical are centered. Note that in this picture mode version of <code>\makebox</code> a [b] aligns on the <i>bottom</i> of the text as documented. If you want to align on the <i>baseline</i> use <code>\makebox(,) [b]{\raisebox{0pt}[\height][0pt]{xyz}}</code> or <code>\makebox(,) [b]{\smash{xyz}}</code>
<code>\mbox</code>	<code>\mbox{⟨obj⟩}</code> The same as <code>\makebox{⟨obj⟩}</code> , but is more efficient as no checking for optional arguments is done.
<code>\newsavebox</code>	<code>\newsavebox{⟨cmd⟩}</code> : If <code>⟨cmd⟩</code> is undefined, then defines it to be a T _E X box register.
<code>\savebox</code>	<code>\savebox{⟨cmd⟩} ...</code> : <code>⟨cmd⟩</code> is defined to be a T _E X box register, and the '...' are any <code>\makebox</code> arguments. It is like <code>\makebox</code> , except it doesn't produce text but saves the value in <code>\box ⟨cmd⟩</code> .
<code>\sbox</code>	<code>\sbox{⟨cmd⟩}{⟨obj⟩}</code> is an efficient abbreviation for <code>\savebox{⟨cmd⟩}{⟨obj⟩}</code> .
<code>\lrbox</code>	<code>\begin{lrbox}{⟨cmd⟩}⟨text⟩\end{lrbox}</code> is equivalent to <code>\sbox{⟨cmd⟩}{⟨text⟩}</code> except that any white space at the beginning and end of <code>⟨text⟩</code> is ignored.
<code>\framebox</code>	<code>\framebox ...</code> : like <code>\makebox</code> , except it puts a 'frame' around the box. The frame is made of lines of thickness <code>\fboxrule</code> , separated by space <code>\fboxsep</code> from the text – except for <code>\framebox(X,Y) ...</code> , where the thickness of the lines is as for the picture environment, and there is no separation added.
<code>\fbox</code>	<code>\fbox{⟨obj⟩}</code> is an abbreviation for <code>\framebox{⟨obj⟩}</code> .
<code>\parbox</code>	<code>\parbox[⟨pos⟩][⟨height⟩][⟨inner-pos⟩]{⟨width⟩}{⟨text⟩}</code> : Makes a box with <code>\hsize ⟨width⟩</code> , positioned by <code>⟨pos⟩</code> as follows: c : <code>\vcenter</code> (placed in <code>\$. . . \$</code> if not in math mode) b : <code>\vbox</code> t : <code>\vtop</code> default value is c. Sets <code>\hsize := ⟨width⟩</code> and calls <code>\@parboxrestore</code> , which does the following: Restores the original definitions of:

```

\par
\\
\--
\'
\‘
\=
Resets the following parameters:
\parindent      = 0pt
\parskip        = 0pt
\linewidth      = \hsize
\@totalleftmargin = 0pt
\leftskip       = 0pt
\rightskip      = 0pt
\@rightskip     = 0pt
\parfillskip    = 0pt plus 1fil
\lineskip       = \normallineskip
\baselineskip   = \normalbaselineskip
Calls \sloppy
Note: \@arrayparboxrestore same as \@parboxrestore but it doesn't re-
store \\.
minipage      minipage : Similar to \parbox, except it also makes this look like a page by
setting
\textwidth == \columnwidth == box width
changes footnotes by redefining:
\@mpfn == mpfootnote
\thempfn == \thempfootnote
\@footnotetext == \@mpfootnotetext
resets the following list environment parameters:
\@listdepth == \@mplistdepth
where \@mplistdepth is initialized to zero,
and executes \@minipagerestore to allow the document style to reset any
other parameters it desires. It sets @minipage true, and resets \everypar to set it
false. This switch keeps \addvspace from putting space at the top of a minipage.
Change added 24 May 89: \minipage sets @minipage globally; \endminipage
resets it false.
\rule      \rule[\langle raised \rangle]{\langle width \rangle}{\langle height \rangle} : Makes a \langle width \rangle * \langle height \rangle rule, raised
\langle raised \rangle.
\underline \underline{\langle text \rangle} : Makes an underlined hbox with \langle text \rangle in it.
\raisebox \raisebox{\langle distance \rangle}{\langle height \rangle}[\langle depth \rangle]{\langle box \rangle} :
Raises \langle box \rangle up by \langle distance \rangle length (down if \langle distance \rangle negative). Makes TEX
think that the new box extends \langle height \rangle above the line and \langle depth \rangle below, for a
total vertical length of \langle height \rangle + \langle depth \rangle. Default values of \langle height \rangle & \langle depth \rangle =
actual height and depth of box in new position.

`\@arrayparboxrestore` Restore various paragraph parameters.

The rationale for allowing two normally global flags to be set locally here was stated originally by Donald Arsenau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should

never appear within boxes or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in `\set@nobreak`; otherwise this command will be redundant.

```

`\@finalstrut` This macro adds a special strut the *depth* of the box given as `#1`, and height and width 0pt. It is used for ensuring that the last line of a paragraph has the correct depth in ‘p’ columns of tables and in footnotes. In vertical mode nothing is done, as adding the strut (as done in 2.09) would start a new paragraph. It would be possible to inspect `\prevdepth` to check the depth of the just-completed paragraph, but we do not do that here. Actually we do even less now, skip the vmode test as it broke tabular ‘p’ columns. .

The `\nobreak` was added (1995/10/31) to allow hyphenation of the final word of the paragraph.

```
400 \def\@finalstrut#1{%
401   \unskip\ifhmode\nobreak\fi\vrule\@width\z@\@height\z@\@depth\dp#1}
```

66.1 Some low-level constructs

The following commands are basically inherited from plain T_EX.

<code>\leftline</code>	These macros place text on a full line either centred or left or right adjusted.
<code>\rightline</code>	
<code>\centerline</code>	
<code>\@@line</code>	

```

402 \def\@@line{\hb@xt@\hsize}
403 \DeclareRobustCommand\leftline[1]{\@@line{#1\hss}}
404 \DeclareRobustCommand\rightline[1]{\@@line{\hss#1}}
405 \DeclareRobustCommand\centerline[1]{\@@line{\hss#1\hss}}

\rlap These macros place text to the left or right of the current reference point without
\llap taking up space.

406 \DeclareRobustCommand\rlap[1]{\hb@xt@\z@{#1\hss}}
407 \DeclareRobustCommand\llap[1]{\hb@xt@\z@{\hss#1}}

408 \endkernel
```

lttab.dtx

67 Tabbing, Tabular and Array Environments

This section deals with ‘Lining It Up in Columns’. First the `tabbing` environment is defined, and then in second part, `tabular` together with its variants, `tabular*` and `array`.

Note that the `tabular` defined here is essentially the original L^AT_EX 2.09 version, not the extended version described in *The L^AT_EX Companion*. Use the `array` package to obtain the extended version.

67.1 tabbing

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

`\dimen\@firsttab + i` = distance of tab stop `i` from left margin
0 <= `i` <= 15 (?).

`\dimen\@firsttab` is initialized to `\@totalleftmargin`, so it starts at the prevailing left margin.

`\@maxtab` = number of highest defined tab register
probably = `\@firsttab + 12`

`\@nxttabmar` = tab stop number of next line’s left margin

`\@curtabmar` = tab stop number of current line’s left margin

`\@curtab` = number of the current tab. At start of line,
it equals `\@curtabmar`

`\@hightab` = largest tab number currently defined.

`\@tabpush` = depth of `\pushtab`’s

`\box\@curline` = contents of current line, excluding left margin
skip, and excluding contents of current field

`\box\@curfield` = contents of current field

`@rjfield` = switch: T iff the last field of the line should
be right-justified at the right margin.

`\tabbingsep` = distance left by the `\` command between the
current position and the field that is
“left-shifted”.

UTILITY MACROS

`\@stopfield` : closes the current field

`\@addfield` : adds the current field to the current line.

`\@contfield` : continues the current field

`\@startfield` : begins the next field

`\@stopline` : closes the current line and outputs it

```

\@startline : starts the next line
\@ifatmargin : an \if that is true iff the current line.
                has width zero

End of historical L^AT_EX 2.09 comments.

- \a The accents \‘ , \’ , and \= that have been redefined inside a tabbing environment can be called by typing \a‘ , \a’ , and \a=. The macro \a is defined in ltoutenc.dtx.

The ‘2ekernel’ code ensures that a \usepackage{autotabg} is essentially ignored if a ‘full’ format is being used that has picture mode already in the format.

67.2 array and tabular environments

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

ARRAY PARAMETERS:

```

\arraycolsep
    : half the width separating columns in an array environment
\tabcolsep
    : half the width separating columns in a tabular environment
\arrayrulewidth

```

`:` width of rules
`\doublerulesep`
`:` space between adjacent rules in array or tabular
`\arraystretch`
`:` line spacing in array and tabular environments is done by placing a strut in every row of height and depth `\arraystretch` times the height and depth of the strut produced by an ordinary `\strut` command.

PREAMBLE:

The PREAMBLE argument of an array or tabular environment can contain the following:
`l,r,c` : indicate where entry is to be placed.
`|` : for vertical rule
`@{EXP}` : inserts the text EXP in every column.
`\arraycolsep` or `\tabcolsep` spacing is suppressed.
`*{N}{PRE}` : equivalent to writing N copies of PRE in the preamble. PRE may contain `*{N'}{EXP'}` expressions.
`p{LEN}` : makes entry in parbox of width LEN.

SPECIAL ARRAY COMMANDS:

`\multicolumn{N}{FORMAT}{ITEM}` : replaces the next N column items by ITEM, formatted according to FORMAT.
 FORMAT should contain at most one `l,r` or `c`.
 If it contains none, then ITEM is ignored.

`\vline` : draws a vertical line the height of the current row. May appear in an array element entry.
`\hline` : draws a horizontal line between rows. Must appear either before the first entry (to appear above the first row) or right after a `\` command. If followed by another `\hline`, then adds a `\vskip` of `\doublerulesep`.

`\cline{i-j}` : draws horizontal lines between rows covering columns i through j, inclusive. Multiple commands may follow one another to provide lines covering several disjoint columns
`\extracolsep{WIDTH}` : for use inside an `@` in the preamble. Causes a WIDTH space to be added between columns for the rest of the columns. This is in addition to the ordinary intercolumn space.

167 \let\@classz\@tabclassz
168 \let\@classiv\@tabclassiv \let\\\@tabularcr\@tabarray}

\@tabarray RmS 91/11/04 added \m@th.
169 \def\@tabarray{\m@th\ifnextchar[\@array{\@array[c]}}

RmS 1993/11/03 changed \halign to \ialign and removed superfluous
\tabskip assignment

\@array
170 \def\@array[#1]#2{%
171 \if #1t\top \else \if#1b\vbox \else \vcenter \fi\fi
172 \bgroup

This next bit of code sets up the strut and then builds the halign and its preamble
according to the specification in the second argument.

This code has been moved inside the box. A side effect of this has been to
expose what was a buglet in the previous version: since the \@arstrut below is
expanded and contains an \ifmmode then it could produce an unnecessary extra
box in every row, thus wasting ‘lots of’ main memory.

173 \setbox\@arstrutbox\hbox{%
174 \vrule \@height\arraystretch\ht\strutbox
175 \@depth\arraystretch \dp\strutbox
176 \@width\z@}%
177 \mkpream{#2}%
178 \edef\@preamble{%
179 \ialign \noexpand\@halignto
180 \bgroup \@arstrut \@preamble \tabskip\z@skip \cr}%

That is the end of setting up the preamble; now we reset things before executing
the halign built-up in \@preamble. The restorations could be done by introducing
an extra group, thus saving tokens.

181 \let\@startpbox\@startpbox \let\@endpbox\@endpbox
182 \let\tabularnewline\\%
183 \let\par\@empty
184 \let\@sharp##%
185 \set@typeset@protect
186 \lineskip\z@skip\baselineskip\z@skip

If the parsing of the preamble goes wrong there may be some characters left which
TeX then tries to typeset, i.e., we would be in horizontal mode. That would
produce an endless loop because the \halign expects vertical mode thus issues a
\par but that is a no-op at this point. So we better test this case issue some error
message and make a crude recovery by ending that horizontal mode with force. A
better fix would be to ensure that we never pick up more than a single character
token (not done).

End of historical L^AT_EX 2.09 comments.

The command `\def\@addamp{}` was removed from `\multicolumn` on 6 Dec 86 because it caused embedded array environments not to work. I think that it

was included originally to prevent an error message if the 2nd argument to the `\multicolumn` command had two column specifiers.

8 Feb 89 — `\hbox{}` added after `\@preamble` to correct bug that occurred if `\multicolumn` preceded `\\[D]` with $D > 0$, caused by `\\[]` command doing an `\unskip`, which removed `\tabcolsep` glue inserted by `\multicolumn`.

This has been made long so that, for example, a p-column can contain multiple paragraphs; maybe the arguments of @-expressions should also be able to contain multiple paragraphs.

```

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

Codes for classes and character numbers of array, tabular and multicolumn arguments.

Character	Class	Number
c	0	0
l	0	1
r	0	2
l	1	-
@	2	-
p	3	-
{@-exp}	4	-
{p-arg}	5	-

`\@testpach \foo` : expands `\foo`, which should be an array parameter token, and sets `\@chclass` and `\@chnum` to its class and number. Uses `\@lastchclass` to distinguish 4 and 5

Preamble error codes

- 0: 'illegal character'
- 1: 'Missing @-exp'
- 2: 'Missing p-arg'

```

\cline The old LATEX 2.09 implementation of \cline used up quite a lot of memory and
\@cline two precious count registers. This new (1995/09/14) implementation does not use
any count registers. It is coded in a way that depends heavily on the definition of
\multispan so that command has been moved here from the file ltplain.dtx.
These counters are no longer declared.

\newcount\@cla
\newcount\@clb

```

```

343 \def\cline#1{\@cline#1\@nil}

344 \def\@cline#1-#2\@nil{%
345   \omit

Use the counter from \multispan.
346   \@multicnt#1%
347   \advance\@multispan\m@ne
348   \ifnum\@multicnt=\@ne\@firstofone{&\omit}\fi
349   \@multicnt#2%
350   \advance\@multicnt-#1%
351   \advance\@multispan\@ne

The original had \unskip at this point, but how could a skip get here ???
352   \leaders\hrule\@height\arrayrulewidth\hfill
353   \cr

This is back spacing is fairly horrible, but it is what happened in the old version...
An alternative would be to make \cline look ahead for a following \cline as does
\hline. This would alter the spacing in existing documents so keep the old version
in the kernel. Perhaps a package should do this differently.
354   \noalign{\vskip-\arrayrulewidth}}

\mscount The \mscount counter is no longer declared, saving a csname and a register. It is
declared in compatibility mode.

\multispan Modify \multispan slightly from its plain TeX definition to allow more efficient
\@multispan code sharing with \multicolumn. Also share a count register with \multiput.
\sp@n
355 \def\multispan{\omit\@multispan}

68 Picture Mode

Picture mode commands. In addition to the commands available in L^AT_EX 2.09, This section adds the new `\qbezier` command for drawing curves.

`\qbezier` `\qbezier[$\langle N \rangle$]($\langle AX,AY \rangle$)($\langle BX,BY \rangle$)($\langle CX,CY \rangle$)` plots a quadratic Bezier curve from ($\langle AX,AY \rangle$) to ($\langle CX,CY \rangle$), with ($\langle BX,BY \rangle$) as the third Bezier point, using $N + 1$ points equally spaced parametrically. If $N = 0$ (the default value), then a sufficient number of points are used to draw a connected curve—except that at most `\qbeziermax + 1` points are drawn. A “point” is a square of side `\@wholewidth`.

`\bezier` In addition, to be compatible with the old `bezier` package, a variant of this command, `\bezier`, is defined, in which the first argument is not optional.

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

<code>\unitlength</code>	= value of dimension argument
<code>\@wholewidth</code>	= current line width
<code>\@halfwidth</code>	= half of current line width
<code>\@linefont</code>	= font for drawing lines
<code>\@circlefont</code>	= font for drawing circles

`\linethickness{DIM}` : Sets the width of horizontal and vertical lines in a picture to DIM. Does not change width of slanted lines or circles. Width of all lines reset by `\thinlines` and `\thicklines`

```

\picture(XSIZE,YSIZE)(XORG,YORG)
  BEGIN
    \@picht :=L YSIZE * \unitlength
    box \@picbox :=
      \hb@xt@ XSIZE * \unitlength

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

CIRCLES AND OVALS

USER COMMANDS:

`\circle{D}` : Produces the circle with the diameter as close as possible to $D * \text{\unitlength}$. `\put(X,Y){\circle{D}}` puts the circle with its center at (X,Y).

`\oval(X,Y)` : Makes an oval as round as possible that fits in the rectangle of width $X * \text{\unitlength}$ and height $Y * \text{\unitlength}$. The reference point is the center.

`\oval(X,Y)[POS]` : Same as `\oval(X,Y)` except it draws only the half or quadrant of the oval indicated by POS. E.G., `\oval(X,Y)[t]` draws just the top half and `\oval(X,Y)[br]` draws just the bottom right quadrant. In all cases, the reference point is the same as the unqualified `\oval(X,Y)` command.

`\@ovvert {DELTA1} {DELTA2}` : Makes a vbox containing either the left side or the right side of the oval being constructed. The baseline will coincide with the outside bottom edge of the oval; the left side of the box will coincide with the left edge of the vertical rule. The width of the box will be `\@tempdima`.

DELTA1 and DELTA2 are added to the character number in

`\@tempcnta`

to get the characters for the top and bottom quarter circle pieces.

`\@ovhorz` : Makes an hbox containing the straight rule for either the top or the bottom of the oval being constructed. The baseline will coincide with bottom edge of the rule; the left side of the box will coincide with the left side of the oval. The width of the box will be `\@ovvxx`.

`\@getcirc {DIAM}` : Sets `\@tempcnta` to the character number of the top-right quarter circle with the largest

diameter less than or equal to DIAM.
 Sets \@tempboxa to an hbox containing that character.
 Sets \@tempdima to \wd \@tempboxa, which is the distance
 from the circle's left outside edge to its right
 inside edge.
 (These characters are like those described in the
 TeXbook, pp. 389-90.)

69 Theorem Environments

The user creates his own theorem-like environments with the command

```
\newtheorem{<name>}{<text>}[<counter>] or  
\newtheorem{<name>}[<oldname>]{<text>}
```

This defines the environment $\langle name \rangle$ to be just as one would expect a theorem environment to be, except that it prints $\langle text \rangle$ instead of “Theorem”.

If $\langle oldname \rangle$ is given, then environments $\langle name \rangle$ and $\langle oldname \rangle$ use the same counter, so using a $\langle name \rangle$ environment advances the number of the next $\langle name \rangle$ environment, and vice-versa.

If $\langle counter \rangle$ is given, then environment $\langle name \rangle$ is numbered within $\langle counter \rangle$.

E.g., if $\langle counter \rangle = \text{subsection}$, then the first $\langle name \rangle$ in subsection 7.2 is numbered $\langle text \rangle$ 7.2.1.

The way $\langle name \rangle$ environments are numbered can be changed by redefining $\text{\the}\langle name \rangle$.

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

DOCUMENT STYLE PARAMETERS

$\text{\@thmcounter}\{COUNTER\}$: A command such that

```
\edef\theCOUNTER{\@thmcounter{COUNTER}}
```

defines $\text{\the}COUNTER$ to produce a number for a theorem environment.

The default is:

```
BEGIN \noexpand\arabic{COUNTER} END
```

\@thmcountersep : A separator placed between a theorem number and the number of the counter within which it is numbered.

E.g., to make the third theorem of section 7.2 be numbered 7.2-3, \@thmcountersep should be \def ’ed to ‘-’. Its default is ‘.’.

$\text{\@begintheorem}\{NAME\}\{NUMBER\}$: A command that begins a theorem

environment for a ‘theorem’ named ‘NAME NUMBER’ – e.g., $\text{\@begintheorem}\{Lemma\}\{3.7\}$ starts Lemma 3.7.

$\text{\@opargbegintheorem}\{NAME\}\{NUMBER\}\{OPARG\}$:

A command that begins a theorem environment for a ‘theorem’ named ‘NAME NUMBER’ with

optional

argument OPARG – e.g., $\text{\@begintheorem}\{Lemma\}\{3.7\}\{Jones\}$ starts ‘Lemma 3.7 (Jones)’.

\@endtheorem : A command that ends a theorem environment.

```

\newtheorem{NAME}{TEXT}[COUNTER] ==
  BEGIN
    if \NAME is definable
      then \@definecounter{NAME}
        if COUNTER present
          then \@newctr{NAME}[COUNTER] fi

70 Sectioning Commands

This file defines the declarations such as `\author` which are used by `\maketitle`. `\maketitle` itself is defined by each class, not in the L^AT_EX kernel.

The second part of the file defines the generic commands used for defining sectioning commands such as `\chapter`. Again the actual document level commands are defined in the class files, in terms of these commands.

```
1 \<2kernel>
2 \message{title,}
```

70.1 The Title

```
\title The user defines the title and author by the declarations \title{<name>},
\author \author{<name>}
\date Similarly the date is declared with \date{<date>}.
\thanks Inside these, the \thanks{<footnote text>} command may be used to make
\and acknowledgements, notice of address, etc. in a footnote. If there are multiple
\maketitle authors, they have to be separated with the \and command.
And finally, the \maketitle command produces the actual title, using the
information previously saved with the other commands.

3 \</2kernel>
4 \<*2kernel | latexrelease>
5 \<latexrelease>\IncludeInRelease{2019/10/01}%
6 \<latexrelease> {\title}{Make commands robust}%

\title \title for use in \maketitle. If not given \maketitle will produce an error
message.
7 \DeclareRobustCommand\title[1]{\gdef\@title{#1}}

\author \author for use in \maketitle. If not given \maketitle will produce a warning
message.
8 \DeclareRobustCommand\author[1]{\gdef\@author{#1}}

\date \date for use in \maketitle. If not given \maketitle will produce \today as the
default.
9 \DeclareRobustCommand\date[1]{\gdef\@date{#1}}

```

70.2 Sectioning

```

\@secpenalty
36 \newcount\@secpenalty
37 \@secpenalty = -300

\if@noskipsec \@noskipsectrue
Way back in 1991 (08/26) FMi & RmS set the \@noskipsec switch to true for the
preamble and to false in \document. This was done to trap lists and related text
in the preamble but it does not catch everything.
38 \newif\if@noskipsec \@noskipsectrue

\@startsection
The \@startsection{<name>}{<level>}{<indent>}{<before skip>}
{<after skip>}{<style>}*[<altheading> ]{<heading>} command is the mother of all
the user level sectioning commands. The part after the *, including the * is
optional.

```

name: e.g., 'subsection'

level: a number, denoting depth of section – e.g., chapter = 0, section = 1, etc.

indent: Indentation of heading from left margin

beforeskip: Absolute value = skip to leave above the heading. If negative, then paragraph indent of text following heading is suppressed.

afterskip: if positive, then skip to leave below heading, else negative of skip to leave to right of run-in heading.

style: Commands to set style. Since June 1996 release the *last* command in this argument may be a command such as `\MakeUppercase` or `\fbox` that takes an argument. The section heading will be supplied as the argument to this command. So setting `#6` to, say, `\bfseries\MakeUppercase` would produce bold, uppercase headings.

If ‘`*`’ is missing, then increment the counter. If it is present, then there should be no `[altheading]` argument. The command uses the counter ‘`secnumdepth`’. It contains a pointer to the highest section level that is to be numbered.

Warning: The `\@startsection` command should be at the same or higher grouping level as the text that follows it. For example, you should *not* do something like

```
\def\foo{ \begingroup ...
           \paragraph{...}
           \endgroup}
```

Pseudocode for the `\@startsection` command *Historical L^AT_EX 2.09 comments (not necessarily accurate any more):*

70.3 Table of Contents etc.

70.3.1 Convention

`\tf@{foo}` = file number for output for table foo. The file is opened only if `@filesw = true`.

70.3.2 Commands

A `\l@{type}{<entry>}{<page>}` Macro needs to be defined by document style for making an entry of type `<type>` in a table of contents, etc. E.g., the document style should define `\l@chapter`, `\l@section`, etc.

Note: When the `\protect` command is used in the `<entry>` or `<text>` of one of the commands below, it causes the following control sequence to be written on the file without being expanded. The sequence will be expanded when the table of contents entry is processed.

Surprise: Inside an `\addcontentsline` or `\addtocontents` command argument, the commands: `\index`, `\glossary`, and `\label` are no-ops. This could cause a problem if the user puts an `\index` or `\label` into one of the commands he writes, or into the optional ‘short version’ argument of a `\section` or `\caption` command.

`\@starttoc` The `\@starttoc{<ext>}` command is used to define the commands: `\tableofcontents`, `\listoffigures`, etc.

For example: `\@starttoc{lof}` is used in `\listoffigures`. This command reads the `.<ext>` file and sets up to write the new `.<ext>` file.

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

```
\@starttoc{EXT} ==
  BEGIN
    \begingroup
      \makeatletter
      read file \jobname.EXT
      IF @filesw = true
        THEN open \jobname.EXT as file \tf@EXT
      FI
      @nobreak :=G FALSE %% added 24 May 89
    \endgroup
  END
```

End of historical L^AT_EX 2.09 comments.

```
149 \def\@starttoc#1{%
150   \begingroup
151     \makeatletter
152     \@input{\jobname.#1}%
153     \if@filesw
154       \expandafter\newwrite\csname tf@#1\endcsname
155       \immediate\openout \csname tf@#1\endcsname \jobname.#1\relax
156     \fi
157     \@nobreakfalse
158   \endgroup}
```

`\addcontentsline` The `\addcontentsline{<table>}{<type>}{<entry>}` command allows the user to add his/her own entry to a table of contents, etc. The command adds the entry `\contentsline{<type>}{<entry>}{<page>}` to the `.<table>` file.

This macro is implemented as an application of `\addtocontents`. Note that `\thepage` is not expandable during `\protected@write` therefore one gets the page number at the time of the `\shipout`.

```
159 </2ekernel>
160 <*2ekernel | latexrelease>

172 <latexrelease>\EndIncludeInRelease
173 <*2ekernel>
```

`\addtocontents` The `\addtocontents{<table>}{<text>}` command adds `<text>` to the `.<table>` file, with no page number.

```
174 \long\def\addtocontents#1#2{%
175   \protected@write\@auxout
176     {\let\label\@gobble \let\index\@gobble \let\glossary\@gobble}%
177     {\string\@writefile{#1}{#2}}}
```

`\contentsline` The `\contentsline{<type>}{<entry>}{<page>}` macro produces a `<type>` entry in a table of contents, etc. It will appear in the `.toc` or other file. For example, The entry for subsection 1.4.3 in the table of contents for example, might be produced by:

```
\contentsline{subsection}
{\makebox{30pt}[r]{1.4.3} Gnats and Gnus}{22}
```

The `\protect` command causes command sequences to be written without expanding them.

```
178 \def\contentsline#1{\csname l@#1\endcsname}
```

`\@dottedtocline{<level>}{<indent>}{<numwidth> }{<title>}{<page>}`: Macro to produce a table of contents line with the following parameters:

level If `<level> > \c@tocdepth`, then no line produced.

indent Total indentation from the left margin.

numwidth Width of box for number if the *<title>* has a `\numberline` command.
 As of 25 Jan 1988, this is also the amount of extra indentation added to second and later lines of a multiple line entry.

title Contents of entry.

page Page number.

Uses the following parameters, which must be set by the document style. They should be defined with `\def`'s.

pnumwidth Width of box in which page number is set.

tocrmarg Right margin indentation for all but last line of multiple-line entries.

dotsep Separation between dots, in mu units. Should be `\def`'d to a number like 2 or 1.7

`\@dottedtocline`

223 (latexrelease)
224 (latexrelease)\let\noprotrusion\undefined
225 (latexrelease)\EndIncludeInRelease
226 (*2kernel)

```

Note: \nobreak's added 7 Jan 86 to prevent bad line break that left the page number dangling by itself at left edge of a new line.

Changed 25 Jan 88 to use \leftskip instead of \hangindent so leaders of multiple-line contents entries would line up properly.

\numberline \numberline{<number>}: For use in a \contentsline command. It puts <number> flushleft in a box of width \@tempdima (Before 25 Jan 88 change, it also added \@tempdima to the hanging indentation.)

```

227 \def\numberline#1{\hb@xt@\@tempdima{#1\hfil}}
228 \endkernel)

```

File I

lfloat.dtx

71 Floats

The different types of floats are identified by a $\langle type \rangle$ name, which is the name of the counter for that kind of float. For example, figures are of type ‘figure’ and tables are of type ‘table’. Each $\langle type \rangle$ has associated a positive $\langle type\ number \rangle$, which is a power of two. E.g., figures might have type number 1, tables type number 2, programs type number 4, etc.

The locations where a float can go are specified by a $\langle placement\ specifier \rangle$, which is a list of the possible locations, each denoted by a letter as follows:

h : here	— at the current location in the text.
t : top	— at the top of a text page.
b : bottom	— at the bottom of a text page.
p : page	— on a separate float page

In addition, in conjunction with these, you can use ‘!’ which means that the current values of the float positioning parameters are ignored for this float. (Has no effect on ‘p’, float page positioning.) For example, ‘pht’ specifies that the float can appear in any of three locations: page, here or top.

71.1 Floating Environments

```
1  $\langle *2\text{kernel} \rangle$ 
2  $\text{message}\{\text{floats},\}$ 
```

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

Where floats may appear on a page, and how many may appear there are specified by the following float placement parameters. The numbers are named like counters so the user can set them with the ordinary counter-setting commands.

$\backslash\text{c@topnumber}$: Number of floats allowed at the top of a column.
$\backslash\text{topfraction}$: Fraction of column that can be devoted to floats.
$\backslash\text{c@dbltopnumber}, \backslash\text{dbltopfraction}$: Same as above, but for double-column floats.
$\backslash\text{c@bottomnumber}, \backslash\text{bottomfraction}$: Same as above for bottom of page.
$\backslash\text{c@totalnumber}$: Number of floats allowed in a single column, including in-text floats.
$\backslash\text{textfraction}$: Minimum fraction of column that must contain text.
$\backslash\text{floatpagefraction}$: Minimum fraction of page that must be taken up by float page.
$\backslash\text{dblfloatpagefraction}$: Same as above, for double-column floats.

The document style must define the following.

`\fps@TYPE` : The default placement specifier for floats of type TYPE.

`\ftype@TYPE` : The type number for floats of type TYPE.

`\ext@TYPE` : The file extension indicating the file on which the contents list for float type TYPE is stored.
For example, `\ext@figure = 'lof'`.

`\fnum@TYPE` : A macro to generate the figure number for a caption.
For example, `\fnum@TYPE == Figure \thefigure`.

`\@makecaption{NUM}{TEXT}` :
A macro to make a caption, with NUM the value produced by `\fnum@...` and TEXT the text of the caption. It can assume it's in a `\parbox` of the appropriate width.

`\@float{TYPE}[PLACEMENT]` : This macro begins a float environment for a

single-column float of type TYPE with PLACEMENT as the placement

specifier. The default value of PLACEMENT is defined by `\fps@TYPE`. The environment is ended by `\end@float`.

E.g., `\figure == \@float{figure}, \endfigure == \end@float`.

`\@float{TYPE}[PLACEMENT] ==`

```

In following definition, `\par` moved from after `\addcontentsline` to before `\addcontentsline` because the `\write` could cause an extra blank line to be added to the paragraph above the caption. (Change made 12 Jun 87)

```

\caption{TYPE}[STEXT]{TEXT} ==
BEGIN
    \par
\addcontentsline{\ext@TYPE}{TYPE}{\numberline{\theTYPE}{STEXT}}
    \begingroup
        \@parboxrestore
        \@normalsize
        \makecaption{\fnum@TYPE}{TEXT}
        \par
    \endgroup
END

```

`\@dblfloat{TYPE}[PLACEMENT]` : Macro to begin a float environment for

a double-column float of type TYPE with PLACEMENT as the placement

specifier. The default value of PLACEMENT is 'tp'

The environment is ended by `\end@dblfloat`.

E.g., `\figure* == \@dblfloat{figure}`,

`\endfigure* == \end@dblfloat`.

```

\@dblfloat{TYPE}[PLACEMENT] ==

```

Identical to `\@float{TYPE}[PLACEMENT]` except `\hsize` and `\linewidth` are set to `\textwidth`.
End of historical L^AT_EX 2.09 comments.

`\@floatpenalty`

```
3 \newcount\@floatpenalty
```

`\caption` This is set to be an error message outside a float since no `capttype` is defined there; this may need to be changed by some classes.

```
4 \def\caption{%
5   \ifx\@capttype\undefined
6     \latexerror{\noexpand\caption outside float}\@ehd
7     \expandafter\@gobble
8   \else

12  {\@dblarg{\@caption\@capttype}}%
13 }
```

`\@caption`

```
14 \long\def\@caption#1[#2]#3{%
15   \par
16   \addcontentsline{\csname ext@#1\endcsname}{#1}%
17   {\protect\numberline{\csname the#1\endcsname}{\ignorespaces #2}}%
18   \begingroup
```

The paragraph setting parameters are normalised at this point, however `\@parboxrestore` resets `\everypar` which is not correct in this context so `\@setminipage` is called if needed.

The float mechanism, like `minipage`, sets the flag `@minipage` true before executing the user-supplied text. Many L^AT_EX constructs test for this flag and do not add vertical space when it is true. The intention is that this emulates T_EX's 'top of page' behaviour. The flag must be set false at the start of the first paragraph. This is achieved by a redefinition of `\everypar`, but the call to `\@parboxrestore` removes that redefinition, so it is re-inserted if needed. If the flag is already false then the `\caption` was not the first entry in the float, and so some other paragraph has already activated the special `\everypar`. In this case no further action is needed.

```
19   \@parboxrestore
20   \if@minipage
21     \@setminipage
22   \fi
23   \normalsize
24   \@makecaption{\csname fnum@#1\endcsname}{\ignorespaces #3}\par
25   \endgroup
```

`\@float`

`\@dblflset`

```
26 \def\@float#1{%
27   \ifnextchar[%
28     {\@xfloat{#1}}%
29     {\edef\reserved@a{\noexpand\@xfloat{#1}[\csname fps@#1\endcsname}}%
30     \reserved@a}}
```

`\@dblfloat`

```
31 \def\@dblfloat{%
32   \if@twocolumn\let\reserved@a\@dbflt\else\let\reserved@a\@float\fi
33   \reserved@a}
```

`\fps@dbl` Note that all double floats have default fps ‘tp’.

`\@setfps` This sets the fps, dealing with error conditions by adding the default.

`\@xfloat` The first part of this sets the count register that stores all the information about the type and fps of the float.

We assume here that the default specifiers already contain no active characters.

It may be better to store the defaults as numbers, rather than symbol strings.

The remainder sets up the box in which the float is typeset, and the typesetting environment to be used. It is essential to have the extra box to avoid the unwanted space that would otherwise often be put at the top of the float.

It ends with a hook; not sure how useful this is but it is needed at present to deal with double-column floats.

```

Marginal notes use the same mechanism as floats to communicate with the `\output` routine. Marginal notes are distinguished from floats by having a negative placement specification. The command `\marginpar [LTEXT]{RTEXT}` generates a marginal note in a parbox, using LTEXT if it's on the left and RTEXT if it's on the right. (Default is RTEXT = LTEXT.) It uses the following parameters.

File I: ltfloat.dtx Date: 2015/02/21 Version v1.2c 458

```

\hskip -\marginparwidth \hskip -\marginparsep .
\marginparpush : Minimum vertical separation between \marginpar's

```

Marginal notes are normally put on the outside of the page if @mparswitch = true, and on the right if @mparswitch = false. The command `\reversemarginpar` reverses the side where they are put. `\normalmarginpar` undoes `\reversemarginpar`. These commands have no effect for two-column output.

SURPRISE: if two marginal notes appear on the same line of text, then the second one could appear on the next page, in a funny position.

```

71.2 Footnotes

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

`\footnote{NOTE}` : User command to insert a footnote.

`\footnote[NUM]{NOTE}`: User command to insert a footnote numbered *NUM*, where *NUM* is a number – 1, 2, etc. For example, if footnotes are numbered *, **, etc. within pages, then `\footnote[2]{...}` produces footnote '**'. This command does not step the footnote counter.

`\footnotemark[NUM]` : Command to produce just the footnote mark in the text, but no footnote. With no argument, it steps the footnote counter before generating the mark.

`\footnotetext[NUM]{TEXT}` : Command to produce the footnote but no mark. `\footnote` is equivalent to `\footnotemark \footnotetext` .

As in PLAIN, footnotes use `\insert\footins`, and the following parameters:

- `\footnotesize` : Size-changing command for footnotes.
- `\footnotesep` : The height of a strut placed at the beginning of every footnote.
- `\skip\footins` : Space between main text and footnotes. The rule separating footnotes from text occurs in this space. This space lies above the strut of height `\footnotesep` which is at the beginning of the first footnote.
- `\footnoterule` : Macro to draw the rule separating footnotes from text. It is executed right after a `\vspace` of `\skip\footins`. It should take zero vertical space—i.e., it should to a negative skip to compensate for any positive space it occupies. (See PLAIN.TEX.)
- `\interfootnotelinepenalty` : Interline penalty for footnotes.
- `\thefootnote` : In usual LaTeX style, produces the footnote number. If footnotes are to be numbered within pages, then the document style file must include an `\@addtoreset` command to cause the footnote counter to be reset when the page counter is stepped. This is not a good idea, though, because the counter will not always be reset in time to ensure that the first footnote on a page is footnote number one.
- `\@thefnmark` : Holds the current footnote's mark—e.g., `\dag` or `'1'` or `'a'`.
- `\@mpfnnumber` : A macro that generates the numbers for `\footnote` and `\footnotemark` commands. It == `\thefootnote` outside a minipage environment, but can be changed inside to generate numbers for `\footnote`'s.
- `\@makefnmark` : A macro to generate the footnote marker from `\@thefnmark`. The default definition was `\hbox{$^\@thefnmark$}`.
- This is now replaced by
`\@thefnmark`
- `\@makefntext{NOTE}` :
Must produce the actual footnote, using `\@thefnmark` as the mark of the footnote and `NOTE` as the text. It is called when

effectively inside a `\parbox`, with `\hsize = \columnwidth`.

For example, it might be as simple as

```
$~{\@thefnmark}$ NOTE
```

In a minipage environment, `\footnote` and `\footnotetext` are redefined so that

(a) they use the counter `mpfootnote`

(b) the footnotes they produce go at the bottom of the minipage.

The switch is accomplished by letting `\@mpfn == footnote` or `mpfootnote` and `\thempfn == \thefootnote` or `\thempfootnote`, and by redefining `\@footnotetext` to be `\@mpfootnotetext` in the minipage.

```
\footnote{NOTE} ==

ltbibl.dtx

73 Bibliography Generation

A bibliography is created by the `thebibliography` environment, which generates a title such as “References”, and a list of entries. The `BIBTEX` program will create a file containing such an environment, which will be read in by the `\bibliography` command. With `BIBTEX`, the following commands will be used.

<code>\bibliography</code>	<code>\bibliography{⟨file1,file2, ...,filen⟩}</code> : specifies the bibdata files. Writes a <code>\bibdata</code> entry on the <code>.aux</code> file and tries to read in <code>mainfile.bbl</code> .
<code>\bibliographystyle</code>	<code>\bibliographystyle{⟨style⟩}</code> : Writes a <code>\bibstyle</code> entry on the <code>.aux</code> file.
<code>thebibliography</code>	The <code>thebibliography</code> environment is a list environment. To save the use of an extra counter, it should use <code>enumiv</code> as the item counter. Instead of using <code>\item</code> , items in the bibliography are produced by the following commands: <code>\bibitem{⟨name⟩}</code> : Produces a numbered entry cited as <code>⟨name⟩</code> . <code>\bibitem[⟨label⟩]{⟨name⟩}</code> : Produces an entry labeled by <code>⟨Label⟩</code> and cited by <code>⟨name⟩</code> .

The former is used for bibliographies with citations like [1], [2], etc.; the latter is used for citations like [Knuth82].

The document class must define the `thebibliography` environment. This environment has a single argument, which is the widest bibliography label— e.g., if the [Knuth67] is the widest entry, then this argument will be Knuth67. The `\thebibliography` command must begin a list environment, which the `\endthebibliography` command ends.

<code>\cite</code>	Entries are cited by the command <code>\cite{⟨name⟩}</code> .
<code>\nocite</code>	<code>\nocite{⟨citations⟩}</code> puts information on the <code>.aux</code> file that causes <code>BIBTEX</code> to include the <code>{⟨citations⟩}</code> list in the bibliography, but puts nothing in the text. <code>\nocite{*}</code> is special: it tells <code>BIBTEX</code> to put the whole of a collection of references into the bibliography.

```
1 (*2ekernel)
2 \message{bibliography,}
```

Historical \TeX 2.09 comments (not necessarily accurate any more):
PARAMETERS

<code>@cite</code>	: A macro such that <code>\@cite{LABEL1,LABEL2}{NOTE}</code> produces the output for a <code>\cite[NOTE]{FOO1,FOO2}</code>
command,	where entry <code>FOOi</code> is defined by <code>\bibitem[LABELi]{FOOi}</code> . The switch <code>@tempswa</code> is true if the optional <code>NOTE</code>
argument	is present. The default definition is : <code>\@cite{LABELS}{NOTE} ==</code> <code>BEGIN [LABELS</code> <code>IF @tempswa = T THEN , NOTE FI</code> <code>]</code>

END

`\@biblabel` : A macro to produce the label in the bibliography entry. For `\bibitem[LABEL]{NAME}`, the label is generated by `\@biblabel{LABEL}`. It has the default definition `\@biblabel{LABEL} -> [LABEL]`.

CONVENTION

`\b@F00` : The name or number of the reference created by `\cite{FOO}`
E.g., if `\cite{FOO} -> [17]` , then `\b@F00 -> 17`.

18     \edef\@citeb{\expandafter\@firstofone\@citeb\@empty}}%
19   \if@filesw\immediate\write\@auxout{\string\citation{\@citeb}}\fi
```

Using `\hbox` instead of `\mbox` is fine because of the `\leavevmode` above. In fact the use of a box around the citation contents is more than questionable in my view (FMi), but within 2e I have to keep that for compatibility reasons as it would probably change too many existing documents. Its main reason is to avoid hyphenation of labels such as [FOOB89] into [FOO- B89] so in certain styles it

makes sense; but, for example, in author year citations it becomes more than questionable.

So Chris added yet another hook here, as suggested by, at least, Donald Arsenau. Note that this one is inside the first argument of the `\@cite` hook. This decouples the top-level typesetting of the citation from the details of the other business conducted here. All this really needs a complete rethink to get the right modularity.

```

20      \ifundefined{b@\@citeb}{\hbox{\reset@font\bfseries ?}}%

```

`\bibliographystyle`

```

32 \def\bibliographystyle#1{%
33   \ifx\@begindocumenthook\undefined\else
34     \expandafter\AtBeginDocument
35   \fi
36   {\if@filesw
37     \immediate\write\@auxout{\string\bibstyle{#1}}%
38   \fi}}

```

`\nocite` (Added 14 Jun 85)

This puts information on the `.aux` file that causes BibTeX to include the citation list in the bibliography, but puts nothing in the text.

RmS 93/08/06: Made loop for `\nocite` like that for `\citex`, to get rid of leading spaces.

```

39 \def\nocite#1{\@bsphack

```

With the implementation designed already in L^AT_EX 2.09 the `\nocite` command will not work before `\begin{document}` since it tries to write to the `.aux` file which is not open before that point. As a result the “reference” will appear on the terminal and nothing else will happen.

This would be easy to fix, but then a document using the fix will silently fail on an older release of L^AT_EX, missing all citations done with `\nocite`. Thus we do only generate an error message and leave the fix for a L^AT_EX 2_ε successor.

```

40   \ifx\@onlypreamble\document

```

Since we are after `\begin{document}` we can do the citations:

```

41     \@for\@citeb:=#1\do{%
42       \edef\@citeb{\expandafter\@firstofone\@citeb}%

```

```

43     \if@files\immediate\write\@auxout{\string\citation{\@citeb}}\fi
44     \@ifundefined{b@\@citeb}{\G@refundefinedtrue
45       \latex@warning{Citation '\@citeb' undefined}}{}%
46   \else

```

But before `\begin{document}` we raise an error message:

```

47   \latex@error{Cannot be used in preamble}\@eha

```

Without the compatibility problems we could fix the problem as follows:

```

48   % \AtBeginDocument{\nocite{#1}}
49   \fi
50   \esphack}

```

Since `\nocite{*}` should not produce a warning about undefined citation keys (see PR 557), we need to set the control sequence `'\b@*'` to something other than `\relax`. As a result `\cite{*}` will not warn either (but that never worked with \LaTeX in the first place).

```

51 \expandafter\let\csname b@*\endcsname\@empty

```

73.1 Default definitions

This hook determines the ‘relative formatting’ of the two logical parts of a citation with comment.

`\@cite`

```

52 \def\@cite#1#2{[{\#1\if@tempswa , #2\fi}]}

```

`\@cite@ofmt` This is, in general, a command that appears to have one argument whose value is, in the kernel, a single cs whose name is the expansion of `b@\@citeb`; the expansion of this cs will typically be some hmode material that produces the detailed typeset form of just the citations themselves.

```

53 \let\@cite@ofmt\hbox

ltpage.dtx

74 Page styles and related commands

74.1 Page Style Commands

`\pagestyle{<style>}` : sets the page style of the current and succeeding pages to *style*

`\thispagestyle{<style>}` : sets the page style of the current page only to *style*.

To define a page style *style*, you must define `\ps@style` to set the page style parameters.

74.2 How a page style makes running heads and feet

The `\ps@...` command defines the macros `\@oddhead`, `\@oddfoot`, `\@evenhead`, and `\@evenfoot` to define the running heads and feet. (See output routine.) To make headings determined by the sectioning commands, the page style defines the commands `\chaptermark`, `\sectionmark`, etc., where `\chaptermark{<text>}` is called by `\chapter` to set a mark. The `\...mark` commands and the `\...head` macros are defined with the help of the following macros.

(All the `\...mark` commands should be initialized to no-ops.)

74.3 marking conventions

L^AT_EX extends T_EX's `\mark` facility by producing two kinds of marks a 'left' and a 'right' mark, using the following commands:

`\markboth{<left>}{<right>}` : Adds both marks.

`\markright{<right>}` : Adds a 'right' mark.

`\leftmark` : Used in the output routine, gets the current 'left' mark. Works like T_EX's `\botmark`.

`\rightmark` : Used in the output routine, gets the current 'right' mark. Works like T_EX's `\firstmark`. The marking commands work reasonably well for right marks 'numbered within' left marks—e.g., the left mark is changed by a `\chapter` command and the right mark is changed by a `\section` command. However, it does produce somewhat anomalous results if 2 `\markboth`'s occur on the same page.

Commands like `\tableofcontents` that should set the marks in some page styles use a `\mkboth` command, which is `\let` by the `pagestyle` command (`\ps@...`) to `\markboth` for setting the heading or to `\@gobbletwo` to do nothing.

1 (*2ekernel)

`\pagestyle` User command to set the page style for this and following pages.

```
2 \def\pagestyle#1{%
3   \@ifundefined{ps@#1}%
4     \undefinedpagestyle
5     {\@nameuse{ps@#1}}}
```

`\thispagestyle` User command to set the page style for this page only.

```

6 \def\thispagestyle#1{%
7   \ifundefined{ps@#1}%
8     \undefinedpagestyle
9     {\global\@specialpagetrue\gdef\@specialstyle{#1}}}
```

`\ps@empty` The empty page style: No head or foot line.

```

10 \def\ps@empty{%
11   \let\@mkboth\@gobbletwo\let\@oddhead\@empty\let\@oddfoot\@empty
12   \let\@evenhead\@empty\let\@evenfoot\@empty}
```

`\ps@plain` The plain page style: No head, centred page number in foot.

```

13 \def\ps@plain{\let\@mkboth\@gobbletwo
14   \let\@oddhead\@empty\def\@oddfoot{\reset@font\hfil\thepage
15   \hfil}\let\@evenhead\@empty\let\@evenfoot\@oddfoot}
```

`\@leftmark` We implement `\@leftmark` and `\@rightmark` in terms of already defined commands to save token space. We can't get rid of them since they are sometimes used in applications.

```

16 \let\@leftmark\@firstoftwo
17 \let\@rightmark\@secondoftwo

```

PAGE LAYOUT PARAMETERS

```
\topmargin      : Extra space added to top of page.
@twoside        : boolean. T if two-sided printing
\oddsidemargin  : IF @twoside = T
                  THEN extra space added to left of odd-numbered
                  pages.
                  ELSE extra space added to left of all pages.
\evensidemargin : IF @twoside = T
                  THEN extra space added to left of
even-numbered
                  pages.
\headheight     : height of head
\headsep        : separation between head and text
\footskip       : distance separation between baseline of last
                  line of text and baseline of foot.
                  Note difference between \footSKIP and \headSEP.
\textheight     : height of text on page, excluding head and foot
\textwidth      : width of printing on page
\columnsep      : IF @twocolumn = T
                  THEN width of space between columns
\columnseprule  : IF @twocolumn = T
                  THEN width of rule between columns (0 if none).
\columnwidth    : IF @twocolumn = T
                  THEN (\textwidth - \columnsep)/2
                  ELSE \textwidth
```

It is set by the `\twocolumn` and `\onecolumn` commands.

`\@textbottom` : Command executed at bottom of vbox holding text of page (including figures). The `\raggedbottom` command almost `\let`'s this to `\vfil` (actually sets it to `\vskip \z@ plus.0001fil`). Should have depth 0pt.

`\@texttop` : Command executed at top of vbox holding text of page (including figures). Used by letter style; can also be used to produce centered pages. Let to `\relax` by `\raggedbottom` and `\flushbottom`.

Page layout must initialize `\@colht` and `\@colroom` to `\textheight`.

PAGE STYLE PARAMETERS:

`\floatsep` : Space left between floats.

`\textfloatsep` : Space between last top float or first bottom float and the text.

`\topfigrule` : Command to place rule (or whatever) between floats at top of page and text. Executed in inner vertical mode right before the `\textfloatsep` skip separating the floats from the text. Must occupy zero vertical space. (See `\footnoterule`.)

`\botfigrule` : Same as `\topfigrule`, but put after the `\textfloatsep` skip separating text from the floats at bottom of page.

`\intextsep` : Space left on top and bottom of an in-text float.

`\dblfloatsep` : Space between double-column floats.

`\dbltextfloatsep` : Space between top double-column floats and text.

`\dblfigrule` : Similar to `\topfigrule`, but for double-column floats.

`\@fptop` : Glue to go at top of float column – must be 0pt + stretch

`\@fpsep` : Glue to go between floats in a float column.

`\@fpbot` : Glue to go at bottom of float column – must be 0pt + stretch

`\@dblfpptop`, `\@dblfpsep`, `\@dblfpbot` : Analogous for double-column float page in two-column format.

FOOTNOTES: As in PLAIN, footnotes use `\insert\footins`.

PAGE LAYOUT SWITCHES AND MACROS

`@twocolumn` : Boolean. T if two columns per page globally.

PAGE STYLE MACROS AND SWITCHES

`\@oddhead` : IF `@twoside = T`
THEN macro to generate head of
odd-numbered
pages.
ELSE macro to generate head of all pages.
`\@evenhead` : IF `@twoside = T`
THEN macro to generate head of
even-numbered
pages.
`\@oddfoot` : IF `@twoside = T`
THEN macro to generate foot of
odd-numbered
pages.
ELSE macro to generate foot of all pages.
`\@evenfoot` : IF `@twoside = T`
THEN macro to generate foot of
even-numbered
pages.
`@specialpage` : boolean. T if current page is to have a special
format.
`\@specialstyle` : If its value is `foo` then
IF `@specialpage = T`
THEN the command `\ps@foo` is executed to
temporarily reset the page style parameters
before composing the current page.
This command should execute only `\def`'s
and
`\edef`'s, making only local definitions.

FLOAT PLACEMENT PARAMETERS

The following parameters are set by the macro `\@floatplacement`.
When `\@floatplacement` is called,

`\@colht` is the height of the page or column being built. I.e.:

* For single-column page it equals `\textheight`.

* For double-column page it equals `\textheight - height`
of double-column floats on page.

Note that some are set globally and some locally:

`\@topnum` :=G Maximum number of floats allowed on the top of a
column.

`\@toproom` :=G Maximum amount of top of column devoted to floats—
excluding `\textfloatsep` separation below the floats
and `\floatsep` separation between them. For
two-column output, should be computed as a function
of `\@colht`.

`\@botnum`, `\@botroom`

`:` Analogous to above.
`\@colnum` :=G Maximum number of floats allowed in a column,
including in-text floats.
`\@textmin` :=L Minimum amount of text (excluding footnotes) that
must appear on a text page.
`%% 27 Sep 85 : made local to`
`%% \@addtocurcol and \@addtonextcol`
It is now also used locally in processing double
floats.
`\@fpmin` :=L Minimum height of floats in a float column.

The macro `\dblfloatplacement` sets the following parameters.

`\@dbltopnum` :=G Maximum number of double-column floats allowed
at

the top of a two-column page.

`\@dbltoproom` :=G Maximum height of double-column floats allowed at
top of two-column page.

`\@fpmin` :=L Minimum height of floats in a float column.

It should also perform the following local assignments where necessary
– i.e., where the new value differs from the old one:

`\@fptop` :=L `\dblfpptop`
`\@fpsep` :=L `\dblfpsep`
`\@fpbot` :=L `\dblfpbot`

OUTPUT ROUTINE VARIABLES

`\@colht` : The total height of the current column. In single column
style, it equals `\textheight`. In two-column style, it is
`\textheight` minus the height of the double-column floats
on the current page. MUST BE INITIALIZED TO
`\textheight`.

`\@colroom` : The height available in the current column for text and
footnotes. It equals `\@colht` minus the height of all
floats committed to the top and bottom of the current
column.

`\@textfloatsheight` : The total height of in-text floats on the
current page.

`\@footins` : Footnote insertion number.

`\@maxdepth` : Saved value of TeX's `\maxdepth`. Must be set
when any routine sets `\maxdepth`.

CALLING THE OUTPUT ROUTINE

The output routine is called either by TeX's normal page-breaking
mechanism, or by a macro putting a penalty `<` or `= -10000` in the output

list. In the latter case, the penalty indicates why the output routine was called, using the following code.

penalty	reason
-10000	<code>\pagebreak</code> <code>\newpage</code>
-10001	<code>\clearpage</code> (<code>\penalty -10000 \vbox{} \penalty -10001</code>)
-10002	float insertion, called from horizontal mode
-10003	float insertion, called from vertical mode.
-10004	float insertion.

Note: A float or marginpar puts the following sequence in the output list: (i) a penalty of -10004, (ii) a null `\vbox` (iii) a penalty of -10002 or -10003.

This solves two special problems:

1. If the float comes right after a `\newpage` or `\clearpage`, then the first penalty is ignored, but the second one invokes the output routine.
2. If there is a split footnote on the page, the second 'page' puts out the rest of the footnote.

THE OUTPUT ROUTINE

FUNCTIONS USED IN THE OUTPUT ROUTINE:

`\@outputpage` : Produces an output page with the contents of box `\@outputbox` as the text part.

Also sets `\@colht :=G \textheight`.

The page style is determined as follows.

IF `@thispagestyle = true`

THEN use `\thispagestyle` style

ELSE use ordinary page style.

`\@tryfcolumn\FLIST` : Tries to form a float column composed of floats from `\FLIST` (if nonempty) with the following parameters:

`\@colht` : height of box

`\@fpmin` : minimum height of floats in the box

`\@fpsep` : interfloat space

`\@fptop` : glue at top of box

`\@fpbot` : glue at bottom of box.

If it succeeds, then it does the following:

* `\@outputbox :=L` the composed float box.

* `@fcolmade :=G true`

* `\FLIST :=G \FLIST` - floats put in box

* `\@freelist :=G \@freelist + floats put in box`

If it fails, then:

* `@fcolmade :=G false`

NOTE: BIT MUST BE A SINGLE TOKEN!

`\@makefcolumn \FLIST` : Same as `\@tryfcolumn` except that it fails to make a float column only if `\FLIST` is empty. Otherwise, it makes a float column containing at least the first box in `\FLIST`, disregarding `\@fpmin`.

`\@startcolumn` :
Calls `\@tryfcolumn\@deferlist`. If `\@tryfcolumn` returns with (globally set) `@fcolmade = false`, then:
* Globally sets `\@toplist` and `\@botlist` to floats from `\@deferlist` to go at top and bottom of column, deleting them from `\@deferlist`. It does this using `\@colht` as the total height, the page style parameters `\@floatsep` and `\@textfloatsep`, and the float placement parameters `\@topnum`, `\@toproom`, `\@botnum`, `\@botroom`, `\@colnum` and `\textfraction`.
* Globally sets `\@colroom` to `\@colht` minus the height of the added floats.

`\@startdblcolumn` :
Calls `\@tryfcolumn\@dbldeferlist{8}`. If `\@tryfcolumn` returns with (globally set) `@fcolmade = false`, then:
* Globally sets `\@dbltoplist` to floats from `\@dbldeferlist` to go at top and bottom of column, deleting them from `\@dbldeferlist`. It does this using `\textheight` as the total height, and the parameters `\@dblfloatsep`, etc.
* Globally sets `\@colht` to `\textheight` minus the height of the added floats.

`\@combinefloats` : Combines the text from box `\@outputbox` with the floats from `\@toplist` and `\@botlist`, putting the new box in `\@outputbox`. It uses `\floatsep` and `\textfloatsep` for the appropriate separations. It puts the elements of `\TOPLIST` and `\BOTLIST` onto `\@freelist`, and makes those lists null.

`\@makecol` : Makes the contents of `\box255` plus the accumulated footnotes, plus the floats in `\@toplist` and `\@botlist`, into a single column of height `\@colht` (unless the page height has been locally changed), which it puts into box `\@outputbox`. It puts boxes in `\@midlist` back onto `\@freelist` and restores `\maxdepth`.

`\@opcol` : Outputs a column whose text is in box `\@outputbox`. If `@twocolumn = false`, then it calls `\@outputpage`, sets `\@colht := G \textheight`, and calls `\@floatplacement`.

If @twocolumn = true, then:

If @firstcolumn = true, then it puts box \@outputbox into \@leftcolumn and sets @firstcolumn :=G false.

If @firstcolumn = false, then it puts out the current two-column page, any possible two-column float pages, and determines \@dbltoplist for the next page.

USER COMMANDS THAT CALL OR AFFECT THE OUTPUT ROUTINE

```
\newpage == BEGIN \par\vfil\penalty -10000 END
```

```
\clearpage == BEGIN \newpage
                  \write -1{}      % Part of hack to make sure no
                  \vbox{}          % \write's get lost.
                  \penalty -10001
                END
```

```
\cleardoublepage == BEGIN \clearpage
                        if @twoside = true and c@page is even
                        then \hbox{} \newpage fi
                END
```

`\twocolumn[BOX]` : starts a new page, changing to twocolumn setting and puts BOX in a parbox of width `\textwidth` across the top. Useful for full-width titles for double-column pages.

SURPRISE: The stretch from `\@dbltextfloatsep` will be inserted between the BOX and the top of the two columns.

FLOAT-HANDLING MECHANISMS

The float environment obtains an insertion number B from the `\@freelist` (see below for a description of list manipulation), puts the float into box B and sets `\count B` to a FLOAT SPECIFIER. For a normal (not double-column) float, it then causes a page break in one of the following two ways:

- In outer hmode: `\vadjust{\penalty -10002}`
- In vmode : `\penalty -10003`.

For a double-column float, it puts B onto the `\@dbldeferlist`.

The float specifier has two components:

- * A PLACEMENT SPECIFICATION, describing where the float may be placed.

* A TYPE, which is a power of two—e.g., figures might be type 1 floats, tables type 2 floats, programs type 4 floats, etc. The float specifier is encoded as follows, where bit 0 is the least significant bit.

Bit	Meaning
0	1 iff the float may go where it appears in the text.
1	1 iff the float may go on the top of a page.
2	1 iff the float may go on the bottom of a page.
3	1 iff the float may go on a float page.
4	1 unless the PLACEMENT includes a !
5	1 iff a type 1 float
6	1 iff a type 2 float
etc.	

A negative float specifier is used to indicate a marginal note.

MACROS AND DATA STRUCTURES FOR PROCESSING FLOATS

A FLOAT LIST consisting of the floats in boxes `\boxa ... \boxN` has the form:

```
\@elt \boxa ... \@elt \boxN
```

where `\boxI` is defined by

```
\newinsert\boxI
```

Normally, `\@elt` is `\let` to `\relax`. A test can be performed on the entire float list by locally `\def`'ing `\@elt` appropriately and executing the list.

This is a lot more efficient than looping through the list.

The following macros are used for manipulating float lists.

```
\@next \CS \LIST {NONEMPTY}{EMPTY} == %% NOTE: ASSUME
\@elt = \relax
  BEGIN assume that \LIST == \@elt \B1 ... \@elt \Bn
    if n = 0
      then EMPTY
    else \CS :=L \B1
        \LIST :=G \@elt \B2 ... \@elt \Bn
        NONEMPTY
    fi
  END
```

`\@bitor\NUM\LIST` : Globally sets switch `@test` to the disjunction for all I of bit `log2 \NUM` of the float specifiers of all the floats in `\LIST`.
 I.e., `@test` is set to true iff there is at least one float in `\LIST` having bit `log2 \NUM` of its float specifier

equal to 1.

Note: $\log_2 [(\text{\count I})/32]$ is the bit number corresponding to the type of float I. To see if there is any float in `\LIST` having the same type as float I, you run `\@bitor` with

`\NUM = [(\count I)/32] * 32.`

```
\@bitor\NUM\LIST ==
BEGIN
  @test :=G false
  { \@elt \CTR == if \NUM <> 0 then
                    if \count\CTR / \NUM is odd
                    then @test := true          fi fi
    \LIST
  }
END
```

`\@cons\LIST\NUM` : Globally sets `\LIST := \LIST * \@elt \NUM`

```
\@cons\LIST\NUM ==
BEGIN { \@elt == \relax
        \LIST :=G \LIST \@elt \NUM
      }
```

BOX LISTS FOR FLOAT-PLACEMENT ALGORITHMS

```
\@freelist      : List of empty boxes for placing new floats.
\@toplist       : List of floats to go at top of current column.
\@midlist       : List of floats in middle of current column.
\@botlist       : List of floats to go at bottom of current column.
\@deferlist     : List of floats to go after current column.
\@dbltoplist    : List of double-col. floats to go at top of current
                  page.
\@dbldeferlist  : List of double-column floats to go on subsequent
                  pages.
```

FLOAT-PLACEMENT ALGORITHMS

`\@addtobot` : Tries to put insert `\@currbox` on `\@botlist`.

Called only when:

- * `\ht BOX < \@colroom`
- * type of `\@currbox` not on `\@deferlist`
- * `\@colnum > 0`
- * `@insert = false`

If it succeeds, then:

- * sets `@insert true`
- * decrements `\@botroom` by `\ht BOX`
- * decrements `\@botnum` and `\@colnum` by 1

```

* decrements \@colroom by \ht BOX + either
\floatsep
    or \textfloatsep, as appropriate.
* sets \maxdepth to 0pt

\@addtotoporbot : Tries to put insert \@currbox on \@toplist or
                  \@botlist.
                  Called only under same conditions as \@addtobot.
                  If it succeeds, then:
                    * sets @insert true
                    * decrements \@toproom or \@botroom by \ht
BOX
                    * decrements \@colnum and either \@topnum or
                      \@botnum by 1
                    * decrements \@colroom by \ht BOX +
\floatsep
    or \textfloatsep, as appropriate.

\@addtocurcol : Tries to add \@currbox to current column, setting
                @insert true if it succeeds, false otherwise.
                It will add \@currbox to top only if bit 0 of
                \count \@currbox is 0, and to the bottom only if
                bit 0 = 0 or an earlier float of the same type is
                put on the bottom.
                If the float is put in the text, then
                \penalty\interlinepenalty is put
                right after the float, before the following \vskip,
                and \outputpenalty :=L 0.

\@addtonextcol : Tries to add \@currbox to the next column, setting
                @insert true if it succeeds, false otherwise.

\@addtodblcol : Tries to add \@currbox to the next double-column page,
                adding it to \@dbltoplist if it succeeds and
                \@dbldeferlist if it fails.

\@addmarginpar ==
BEGIN
  if \@currlist nonempty
  then remove \@marbox from \@currlist
    add \@marbox and \@currbox to \@freelist
    %% NOTE: \@currbox = left box
  else LaTeX error: ? %% shouldn't happen

```

The new algorithm stores page wide floats together with column floats in a single `\@deferlist` list. We keep `\@dbldeferlist` initialised as empty so that packages that are testing for deferred floats can use the same code for old or new float handling.

```

70 \gdef\@dbldeferlist{}

```

`\AtBeginDvi` We use a box register in which to put stuff that must appear before anything else in the .dvi file.

The stuff in the box should not add any typeset material to the page when it is unboxed.

```

86 \newbox\@begindvibox
87 \DeclareRobustCommand \AtBeginDvi [1]{%
88   \global \setbox \@begindvibox
89   \vbox{\unvbox \@begindvibox #1}%
90 }

```

`\@maxdepth` This is not the right place to set this; it needs to be set in a class/style file when `\maxdepth` is set.

Also, many settings to `\maxdepth` should be to `\@maxdepth`, probably?

```

91 \newdimen\@maxdepth
92 \@maxdepth = \maxdepth

```

`\paperheight` New `\paper...` registers.

```

\paperwidth 93 \newdimen\paperheight
94 \newdimen\paperwidth

```

`\if@insert` Local switches first:

```

\if@fcolmade 95 \newif \if@insert

```

`\if@specialpage` These should definitely be global:

```

\if@firstcolumn 96 \newif \if@fcolmade
\if@twocolumn 97 \newif \if@specialpage \@specialpagefalse
\if@twoside

```

```

\if@reversemarginpar
\if@mparswitch
\col@number

```

These should be global but are not always set globally in other files.

```
98 \newif \if@firstcolumn \@firstcolumntrue
99 \newif \if@twocolumn \@twocolumnfalse
```

Not sure about these: two questions. Should things which must apply to a whole document be local or global (they probably should be ‘preamble only’ commands)? Are these three such things?

```
100 \newif \if@twoside \@twosidefalse
101 \newif \if@reversemargin \@reversemarginfalse
102 \newif \if@mparswitch \@mparswitchfalse
```

This counter has been imported from ‘multicol’.

```
103 \newcount \col@number
104 \col@number \@ne
```

\newpage The two checks at the beginning ensure that an item label or run-in section title
immediately before a \newpage get printed on the correct page, the one before
the page break.

All three tests are largely to make error processing more robust; that is why
they all reset the flags explicitly, even when it would appear that this would be
done by a \leavevmode.

150 </2ekernel | fltrace>

The \vfil at the end of the macro before the break penalty will normally result
in the page being run short, even with \flushbottom in effect (in contrast to the
behavior of \pagebreak). However, if there is some explicit stretch on the page,
say, a \vfill, it has the undesired side-effect, that the last line will not align
at its baseline if it contains characters going below the baseline, as the value of
\prevdepth is no longer taken into account by TEX. So we back up by that amount
(or by \maxdepth if it is really huge), to mimic the normal behavior without the
\newpage.

241   (/trace)

```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present; but note that this value is larger than that used when checking that page is too full of normal floats.

If there is little room left we just force a page-break, OK? This involves producing two empty columns. The second empty column may be produced by `\output`, in which case an extra, misleading, warning will be generated, OK? (This happens only when there is too little room left on the page for any float.) Otherwise (i.e. if the size is such that it is allowed as a normal float) the extra `\@emptycol` will be invoked in the second column by the conditional code guarded by the `\if@firstcolumn` test.

I now think that the cut-off point here should be `3\baselineskip`, but we make it a bit less so that 3 lines of text will be allowed, OK?

Since this happens only when there is nothing on the page but the ‘top-box’, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

Here we need two page-ends since both columns need to be empty.

```

242 \ifdim \@colht<2.5\baselineskip
243 \latex@warning@no@line {Optional argument of \noexpand\twocolumn
244 too tall on page \thepage}%
245 \emptycol
246 \if@firstcolumn
247 \else
248 \emptycol
249 \fi
250 \else
251 \global \vsize \@colht
252 \global \@colroom \@colht
253 \floatplacement
254 \fi
255 }

```

`\output` This needs some small adjustments. We cannot guarantee that the float mechanism will interact correctly with this stuff, but that mechanism does not always work properly with footnotes already.

RmS 91/09/29:

added reset of `\par` to the output routine. This avoids problems when the output routine is called within a list where `\par` may be a no-op.

```

256 \output {%
257 \let \par \@par
258 \ifnum \outputpenalty<-\@M
259 \specialoutput
260 \else
261 \makecol
262 \opcol

```

Moved to `\@opcol: \@floatplacement`.

```

263 \@startcolumn

```

This loop could be replaced by an `\expandafter` tail recursion in `\@startcolumn`.

```

264 \@whilesw \if@fcolmade \fi
265 {%
266 (*trace)
267 \fl@trace{PAGE: float \if@twocolumn column \else page \fi
268 completed}%
269 (/trace)
270 \@opcol\@startcolumn}%
271 \fi
272 \ifnum \outputpenalty>-\@Miv

```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present. If there is little room left we just force a page-break, OK?

This bit is essential only if a float has just been processed so maybe it should be moved; but this is the natural place at which to set the `vsize` and a test would need to be done anyway. A check has been added to ensure that there really has been a change in the value of `\@colroom`.

Since this happens only when there is nothing on the page but floats, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

The twocolumn case does not need any extra code here since this is the `\output` itself; in the second column there will still not be enough room left so `\@emptycol` will be executed again when the OR is called by the page builder when it gets to the penalty inserted by the first execution. (The page-builder is never invoked whilst the OR is being executed since it builds a inner vlist; thus any conditional code for the two-column case within `\output` may not get executed with the correct value of `\if@firstcolumn`.)

```

273 \ifdim \@colroom<1.5\baselineskip
274 \ifdim \@colroom<\textheight
275 \if@latex@warning@no@line {Text page \thepage\space
276 contains only floats}%

290 \else
291 \global \vsize \maxdimen
292 \fi
293 }

```

Historical L^AT_EX 2.09 comments (not necessarily accurate any more):

CHANGES TO `\@specialoutput`:

* `\penalty\z@` changed to `\penalty\interlinepenalty` so `\samepage` works properly with figure and table environments.
(Changed 23 Oct 86)

* Definition of `\@specialoutput` changed 26 Feb 88 so `\@pageht` and `\@pagedp` aren't changed for a marginal note.
(Change suggested by Chris Rowley.)

End of historical L^AT_EX 2.09 comments.

```

294 \gdef\@specialoutput{%
295 \ifnum \outputpenalty>-\@Mii
296 \doclearpage
297 \else
298 \ifnum \outputpenalty<-\@Miii
299 \ifnum \outputpenalty<-\@MM \deadcycles \z@ \fi
300 \global \setbox\@holdpg \vbox {\unvbox\@cclv}%
301 \else

```

Note that `\boxmaxdepth` should not be set here since we wish to record the natural depth of the holdpg box.

This is changed so as to not lose anything, such as writes and marks, which may get into box 255 and should be returned to the list. This should only happen when the first penalty in the mechanism is discarded and therefore `\@holdpg` should always be void in this case. This can happen because a penalty is discarded whenever there is no box on the list.

It was just: `\setbox\@tempboxa \box \ccclv`.

The last box which is removed is the box put there by the double-penalty mechanism. The `\unskip` then removes the `\topskip` which is put there since the box is the first on the page.

```
302      \global \setbox\@holdpg \vbox{%
303              \unvbox\@holdpg
304              \unvbox\ccclv
```

We must now remove the box added by the float mechanism and the `\topskip` glue therefore added above it by `TEX`.

```
305              \setbox\@tempboxa \lastbox
306              \unskip
307                      }%
```

These two are needed as separate dimensions only by `\@addmarginpar`; for other purposes we put the whole size into `\@pageht` (see below).

```
308      \@pagedp \dp\@holdpg
309      \@pageht \ht\@holdpg
310      \unvbox \@holdpg
311      \@next\@currbox\@currlist{%
312          \ifnum \count\@currbox>\z@
```

Putting the whole size into `\@pageht` (see above).

```
313          \advance \@pageht \@pagedp
314          \ifvoid\footins \else
315              \advance \@pageht \ht\footins
316              \advance \@pageht \skip\footins
317              \advance \@pageht \dp\footins
318          \fi
319          \ifvbox \@kludgeins
```

We want to make the adjustment due to this insert only if the non-star form is used. The `*`-form will probably not work with floats, but maybe it still could make some adjustment here even so?

```
320          \ifdim \wd\@kludgeins=\z@
321              \advance \@pageht \ht\@kludgeins
322      (*trace)
323          \fl@trace {Extra size added: \the \ht\@kludgeins}%
324      (/trace)
325          \fi
326      \fi
```

This version puts the inserts back just before the additional material; it could be moved earlier, before unboxing the page-so-far. Neither is guaranteed not to put things on the wrong page. This version is similar to the original version.

```
327      \@reinserts
328      \@addtocurcol
329      \else
330          \@reinserts
331          \@addmarginpar
```

```

332         \fi
333     }\@latexbug

```

A 2e change: use `\addpenalty` instead of `\penalty` here. Some penalty is needed to create a potential break-point immediately after the reinserts (or the marginal). Otherwise there can be no possibility to break here and this can cause the reinserts or the marginal to appear on the next page (which is often incorrect). However, if the `nobreak` flag is true, a `\nobreak` must be correct.

```

334         \ifnum \outputpenalty<\z@
335             \if@nobreak
336                 \nobreak
337             \else
338                 \addpenalty \interlinepenalty
339             \fi
340         \fi
341     \fi
342 \fi
343 }
344 \if2kernel | fltrace)

```

`\@doclearpage` This is a very much an emergency action, just dumping everything: footnotes first then floats. A more sophisticated version is needed; but even more urgent is a bug-free version (see, for example, pr/3528).

Also, it puts any left-over non-boxes (writes, specials, etc.) back after any float pages created: this is a very bad bug since, for example, a kludge insert will be in quite the wrong place and, worse, be irremovable and uncancelable.

All the remaining changes are replacing the double column defer list or inserting the extra test `\@testwrongwidth{<box>}` at suitable places. That is at places where a box is taken off the deferlist.

`\@opcol` Several changes in detail here.

```

465 (*2ekernel|fltrace)
466 \def \@opcol {%
467   \if@twocolumn
468     \@outputdblcol
469   \else
470     \@outputpage
471 (*trace)
472   \fl@trace{PAGE: one column (float? see above) page completed}%
473 /trace)

```

Not needed since it comes after `\@outputpage`:

```

474 %   \global\@colht\textheight
475 \fi

```

These do not need to be done every time `\@opcol` is used: they should be grouped together since they all need to be done at the end of the non-special output routine, or at the end of a clearpage one.

```

476 \global \@mparbottom \z@ \global \@textfloatsheight \z@
477 \@floatplacement
478 }
479 /2ekernel|fltrace)

```

`\@makecol` We must rewrite this macro to allow for variations in page-makeup required by changes in page-length.

This uses a different macro if a special-length column is being produced.

```

480 (*2ekernel)
481 \gdef \@makecol {%
482   \ifvoid\footins
483     \setbox\@outputbox \box\@cclv
484   \else
485     \setbox\@outputbox \vbox {%

```

This `\boxmaxdepth` setting is to ensure that deep footnotes do not overwrite the footer (on account of the negative skip added later): it should use `\@maxdepth` otherwise the change is pointless when there are footnotes.

But see also its use when combining floats.

```

486       \boxmaxdepth \@maxdepth

487 %       \@tempdima\dp\@cclv
488       \unvbox \@cclv
489 %       \vskip-\@tempdima
490       \vskip \skip\footins

491       \color@begingroup
492       \normalcolor

```

```

493         \footnoterule
494         \unvbox \footins
495         \color@endgroup
496     }%
497 \fi

```

The h floats have now been finally committed to this page so we can reset their list. The top and bottom floats are then added to the page.

```

498 \let\@elt\relax
499 \xdef\@freelist{\@freelist\@midlist}%

500 \global \let \@midlist \@empty
501 \@combinefloats

```

The variations start here in case \enlargethispage has been used.

```

502 \ifvbox\@kludgeins
503     \@makespecialcolbox
504 \else

```

This extra reboxing is only needed to add the \@texttop and \@textbottom but this could be done earlier, when the floats are added.

The \boxmaxdepth resetting here will have no effect unless \@textbottom ends with a box or rule. So is this (or possibly \@maxdepth) the correct value?

The \vskip -\dimen@ ensures that the visible depth of the box does not affect the placement of anything on the page. Thus very deep pages will overprint the footer; but these should have been prevented by suitable settings of the maxdepths at appropriate times.

If \@textbottom ends with a box or rule of non-zero depth then this skip adjustment should be done again after it.

I think that the final boxing of the main text page could have a common ending which may make it simpler to see what is going on.

This needs further investigation, especially in the ‘special case’.

Also, the \boxmaxdepth setting here affects what happens within \@texttop and \@textbottom, should it? Is it needed at all?

RmS 91/10/22: Replaced \dimen128 by \dimen@.

```

505     \setbox\@outputbox \vbox to\@colht {%
506 %         \boxmaxdepth \maxdepth           %??
507         \@texttop
508         \dimen@ \dp\@outputbox
509         \unvbox \@outputbox
510         \vskip -\dimen@
511         \@textbottom
512     }%
513 \fi
514 \global \maxdepth \@maxdepth
515 }

```

\@reinserts This is the code which reinserts the inserts. It puts them all in one place; this can make some of them come out on the wrong page. It has been put into a separate macro to expedite experimentation.

```

516 \gdef \@reinserts{%
517     \ifvoid\footins\else\insert\footins{\unvbox\footins}\fi
518     \ifvbox\@kludgeins\insert\@kludgeins

```

```

519             {\unvbox\@kludgeins}\fi
520 }
521 \end{kernel}

```

\@makespecialcolbox This implements certain variations in page-makeup.

```

522 (*2kernel | fltrace)
523 \gdef \@makespecialcolbox {%
524 (*trace)
525   \fl@trace{Kludgeins ht \the\ht\@kludgeins\space
526               dp \the\dp\@kludgeins\space
527               wd \the\wd\@kludgeins}%
528 \end{trace}

```

First we find the natural height of the column.

See above for discussion of what is happening here.

This needs further investigation, especially in this ‘special case’.

```

529   \setbox\@outputbox \vbox {%
530     \texttop
531     \dimen@ \dp\@outputbox
532     \unvbox\@outputbox
533     \vskip-\dimen@
534   }%
535   \@tempdima \@colht
536   \ifdim \wd\@kludgeins>\z@

```

Note that in this case (the *-version), the height of the \@kludgeins box is not used since its value is somewhat arbitrary: it need only be big enough to ensure that the page-break is not taken prematurely.

Here we calculate how much vertical space needs to be added in order to enable the column to fit into a box of size \@colht using the best information we have about the amount of shrink available (another thing which is known internally about a box, but cannot be accessed at the T_EX level!).

This needs T_EX3 otherwise \pageshrink is zero anyway; it may not be exactly the figure we wish as it is the total available from the all the material collected before the page-break decision is made. It will, we think, always be an overestimate of the actual shrink in the box; therefore this should always force the shortest possible column with the possibility of an overfull box.

This should work for both the flush- and ragged-bottom setting since it makes the contents no smaller than the size (\@colht) of the box into which they are put.

Their should perhaps be an upper limit, of 0pt?, on the extra space added to force shrinking.

See above for a discussion of the \boxmaxdepth setting here.

```

537   \advance \@tempdima -\ht\@outputbox
538   \advance \@tempdima \pageshrink
539 (*trace)
540   \fl@trace {Natural ht of col: \the \ht\@outputbox}%
541   \fl@trace {\string \@colht: \the \@colht}%
542   \fl@trace {Pageshrink added: \the \pageshrink}%
543   \fl@trace {Hence, space added: \the \@tempdima}%
544 \end{trace}
545   \setbox\@outputbox \vbox to \@colht {%
546 %       \boxmaxdepth \maxdepth

```

```

547      \unvbox\@outputbox
548      \vskip \@tempdima
549      \@textbottom
550      }%

```

For the unstarred version, the final size of the page is precisely specified. Therefore, at least for the flush-bottom case, we need to ensure that, visually, it has this size exactly.

Thus we calculate this size and set the material in a box of this size, which is then put into a box of size `\@colht` with `\vss` at the bottom.

```

551  \else
552    \advance \@tempdima -\ht\@kludgeins
553  (*trace)
554    \fl@trace {Natural ht of col: \the \ht\@outputbox}%
555    \fl@trace {\string \@colht: \the \@colht}%
556    \fl@trace {Extra size added: -\the \ht \@kludgeins}%
557    \fl@trace {Hence, height of inner box: \the \@tempdima}%
558    \fl@trace {Max? pageshrink available: \the \pageshrink}%
559  (/trace)

```

This type of final packaging could be done always; this may simplify all of this page-makeup.

It is not necessary to set `\boxmaxdepth` here since the `\@outputbox` ends with glue.

```

560    \setbox \@outputbox \vbox to \@colht {%
561      \vbox to \@tempdima {%
562        \unvbox\@outputbox
563        \@textbottom}%
564      \vss}%
565  \fi

```

Finally we need to explicitly make the insert box void.

```

566    {\setbox \@tempboxa \box \@kludgeins}%
567  (*trace)
568    \fl@trace {kludgeins box made void}%
569  (/trace)
570 }
571 (/2ekernel | fltrace)

```

`\@texttop` These do nothing as a default.

```

\@textbottom 572 (*2ekernel)
573 \let \@texttop \relax
574 \let \@textbottom \relax

```

`\@resetactivechars` RmS 93/09/06: added hook to protect against certain active characters in the
`\@activechar@info` output routine. Default checks are for active space and end-of-line.

```

575 \def\@activechar@info #1{%
576   \@latex@info@no@line {Active #1 character found while
577     output routine is active
578     \MessageBreak
579     This may be a bug in a package file
580     you are using}%
581 }

```

Do not put any spaces in this next bit!

```
582 \begingroup
583 \obeylines\obeyspaces%
584 \catcode'\'\active%
585 \gdef\@resetactivechars{%
586 \def^^M{\@activechar@info{EOL}\space}%
587 \def {\@activechar@info{space}\space}%
588 \let'\active@math@prime}%
589 \endgroup
```

`\@outputpage` The `\color@hbox` hooks here are used to avoid putting just a colour special into an otherwise empty box (in a header or footer). These boxes are often set to be completely empty and so adding a special produces a very underfull box message.

`\@shipoutsetup` There has been extensive tidying up of the old code here; including the removal of a level of grouping.

`\@writsetup` The setting of `\protect` immediately before the `\shipout` is needed so that protected commands within `\writes` are handled correctly.

Within `shipout's vbox` it is reset to its default value, `\relax`.

Resetting it to its default value after the `shipout` has been completed (and the contents of the `writes` have been expanded) must be done by use of `\aftergroup`. This is because it must have the value `\relax` before macros coming from other uses of `\aftergroup` within this box are expanded.

Putting this into the `\aftergroup` token list does not affect the definition used in expanding the `\writes` because the `aftergroup` token list is only constructed when popping the save-stack, it is not expanded until after the `shipout` is completed.

Question: should things from an `\aftergroup` within the shipped out box be executed in the environment set up for the `writes`, or after it finishes?

A lot of this code has been in-lined to prevent mis-use of internal commands as hooks.

```
590 \</2ekernel>
591 \<latexrelease>\IncludeInRelease{2017/04/15}%
592 \<latexrelease> {\@outputpage}{Reset language for hyphenation}%
593 \<*2ekernel|latexrelease>
594 \def\@outputpage{%
```

The `\endgroup` is put in by `\aftergroup`.

```
595 \begingroup
```

Now all the set-up stuff has been in-lined for Frank.

First the stuff for the `writes`.

From here ... was in the command `\@writsetup`.

```
596 \let \protect \noexpand
```

RmS 93/08/19: Redefined accents to allow changes in font encoding; but exactly why was this needed?

Reset `\language` to the value current at `\begin{document}`. In particular this ensures that a pagebreak in `verbatim` does not prevent hyphenation in the page head.

```
597 \language\document@default@language
```

The `\catcode'\ = 10` was removed as it was considered useless (presumably because nothing gets tokenised during `shipout`).

This was put in as some error produced active spaces in a mark, I think.
Why was the hyphen reset?

```
598 \resetactivechars
```

If a page break happens between the start of a list and its first item the `@newlist` will be true and this will mess up any list that is used in the header or footer of the page. So we have to reset that flag.

```
599 \global\let\@@if@newlist@if@newlist
600 \global\@newlistfalse
```

This next hook replaces the following:

```
\let\-\@dischyph
\let\'\'@acci\let\'\'@accii\let\=\@acciii
\let\\ \@normalcr
\let\par\@par %% 15 Sep 87 (this was once inside the box)
```

and it does more than they did; in particular it sets:

```
\parindent\z@
\parskip\z@skip
\everypar{}%
\leftskip\z@skip
\rightskip\z@skip
\parfillskip\@flushglue
\lineskip\normallineskip
\baselineskip\normalbaselineskip
\sloppy
```

```
601 \@parboxrestore
```

... to here was in the command `\@writsetup`.

```
602 \shipout \vbox{%
603   \set@typeset@protect
604   \aftergroup \endgroup
```

Correct? or just restore by ending the group?

```
605   \aftergroup \set@typeset@protect
```

This first bit has been moved inside the shipped out box.

Now the setup inside the shipped out box; this should contain all the stuff that could only affect typesetting; other stuff may need to be reset for the writes also.

From here ... was in the command `\@shipoutsetup`.

```
606 \if@specialpage
607   \global\@specialpagefalse\@nameuse{ps@\@specialstyle}%
608   \fi
609 \if@twoside
610   \ifodd\count\z@ \let\@thehead\@oddhead \let\@thefoot\@oddfoot
611     \let\@themargin\oddsidemargin
612   \else \let\@thehead\@evenhead
613     \let\@thefoot\@evenfoot \let\@themargin\evensidemargin
614   \fi
615 \fi
```

The rest was always inside the box.

RmS 91/08/15: aded this line:

```
616 \reset@font
```

RmS 93/08/06 Added `\lineskiplimit=0pt` to guard against it being nonzero:
e.g. by `\offinterlineskip` being in effect.

There are probably lots of other things that may need resetting.

```
617 \normalsize
```

Reset the space factors.

```
618 \normalsfcodes
```

Reset these here (previously reset separately for head and foot)

```
619 \let\label\@gobble
```

```
620 \let\index\@gobble
```

```
621 \let\glossary\@gobble
```

```
622 \baselineskip\z@skip \lineskip\z@skip \lineskiplimit\z@
```

... to here was in the command `\@shipoutsetup`.

```
623 \@beginndvi
```

```
624 \vskip \topmargin
```

```
625 \moveright\@themargin \vbox {%
```

```

761 \xdef \@freelist {\@freelist\@dbltoplist}%
762 \global\let \@dbltoplist \@empty
763 \setbox\@outputbox \vbox to\textheight

```

The setting of `\boxmaxdepth` here has no effect since the `\@outputbox` should already have depth zero. Even so, it would have no effect on the layout of the page.

```

764 {\boxmaxdepth\maxdepth %% probably not needed, CAR
765 \unvbox\@tempboxa\vskip-\dblfloatsep

```

Here we need different typesetting if the top float comes from `\@topnewpage`.

```

766 \ifnum \@dbltopnum>\m@ne
767 \dblfigrule
768 \fi
769 \vskip \dbltextfloatsep

```

If pdf links are present in the galley and those links get broken across pages they have to end up being on the same level of boxing (even if not actually in the same structure) due to some engine restrictions in pdf \TeX and Lua \TeX . We therefore unbox `\@outputbox` here (which only contains a single `\hbox`) so that this case has the same boxing level as a normal twocolumn page without top floats.

```

770 \unvbox\@outputbox
771 }%
772 \fi
773 }
774 \end{kernel}

```

`\@startcolumn` We could combine (most of) these two into `\@startcol <list>`. Note that `\@xstartcol` was only used once (i.e. in `\@startcolumn`); it has therefore been removed. This is not quite as efficient but it now has the same structure as `\@startdblcolumn`.

The empty-list test has been moved to `\@tryfcolumn`.

```

```

CHANGE TO \@addtocurcol:

\penalty\z@ changed to \penalty\interlinepenalty so \samepage works properly with figure and table environments. (Changed 23 Oct 86)

There is also an \addpenalty\interlinepenalty above.

Since in 2e \samepage is no longer supported, these could be removed.

Although it is best to use \addvspace in case two h floats come together, this makes other spacing more difficult to adjust; whereas if a user specifies two h floats together then they can more easily get the spacing correct by ad hoc commands.

It is necessary to adjust for the addition of \parskip here in case the float is added between paragraphs (i.e. when in vertical mode).

If the nobreak switch is true we need to reset it and clear \everypar since the float may not reset the flag and cannot reset the \everypar globally.

Typesetting starts here (we are in vertical mode).

```

1148 \if@nobreak
1149 \nobreak
1150 \@nobreakfalse

```

```

1151             \everypar{}%
1152         \else
1153             \addpenalty \interlinepenalty
1154         \fi
1155         \vskip \intextsep
1156         \box\@currbox

1236 (latexrelease | fltrace | flafter) \else
1237 (latexrelease | fltrace | flafter) \@flsettextmin

```

This is a new adjustment which is quite a major change in functionality; but it implements the documentation. Note that `\@reqcolroom` will include the whole of the page-so-far, and hence includes `\@textfloatsheight` of floats, so before comparing it with `\@textmin`, we add this to `\@textmin` also.

```

1238 (*trace)
1239 (latexrelease | fltrace | flafter) \fl@trace{textfloatsheight (before) =
1240 (latexrelease | fltrace | flafter) \the \@textfloatsheight}%
1241 (/trace)
1242 (latexrelease | fltrace | flafter) \advance \@textmin \@textfloatsheight
1243 (latexrelease | fltrace | flafter) \@reqcolroom \@pageht

```

This line must be removed since `\@specialoutput` changed.

```

CHANGE TO \@addtocurcol:
\penalty\z@ changed to \penalty\interlinepenalty so \samepage works
properly with figure and table environments. (Changed 23 Oct 86)
There is also an \addpenalty\interlinepenalty above.
Since in 2e \samepage is no longer supported, these could be removed.
Although it is best to use \addvspace in case two h floats come together, this
makes other spacing more difficult to adjust; whereas if a user specifies two h floats
together then they can more easily get the spacing correct by ad hoc commands.
It is necessary to adjust for the addition of \parskip here in case the float is
added between paragraphs (i.e. when in vertical mode).
If the nobreak switch is true we need to reset it and clear \everypar since the
float may not reset the flag and cannot reset the \everypar globally.
Typesetting starts here (we are in vertical mode).
1314 <latexrelease | fltrace | flafter>          \if@nobreak

Next set of docstrip guards are a bit weird, essentially \@addtotoporbot ends up
inside the kernel and the fltrace package and \@addtotoporbot shows up in the
flafter package. Guess that could have been done a bit more obvious :-)

1819     \fi
1820     \if@reversemargin \@tempcnta -\@tempcnta \fi
1821   \fi
1822   \ifnum\@tempcnta <\z@ \global\setbox\@marbox\box\@currbox \fi
1823   \@tempdima\@mparbottom
1824   \advance\@tempdima -\@pageht
1825   \advance\@tempdima\ht\@marbox
1826   \ifdim\@tempdima >\z@
1827     \@latex@warning@no@line {Marginpar on page \thepage\space moved}%
1828   \else
1829     \@tempdima\z@
1830   \fi
1831   \global\@mparbottom\@pageht
1832   \global\advance\@mparbottom\@tempdima
1833   \global\advance\@mparbottom\dp\@marbox
1834   \global\advance\@mparbottom\marginparpush
1835   \advance\@tempdima -\ht\@marbox

```

Putting box movement inside the ‘marbox’:

```

1836 \global\setbox \@marbox
1837         \vbox {\vskip \@tempdima
1838             \box \@marbox}%
1839 \global \ht\@marbox \z@
1840 \global \dp\@marbox \z@

```

Sticking (rather than gluing:-) the ‘marbox’ to the line above, changed vskip to kern:

```

1841 \kern -\@pagedp
1842 \nointerlineskip
1843 \hb@xt@\columnwidth
1844   {\ifnum \@tempcnta >\z@
1845     \hskip\columnwidth \hskip\marginparsep
1846   \else
1847     \hskip -\marginparsep \hskip -\marginparwidth
1848   \fi
1849   \box\@marbox \hss}%

```

For this reason the following code can vanish:

```

\ nobreak           %% No longer needed. CAR92/12
\ vskip -\@tempdima %% No longer needed. CAR92/12

1850 \nointerlineskip
1851 \hbox{\vrule \@height\z@ \@width\z@ \@depth\@pagedp}}

```

75.1.1 Kludgeins

This part of the file is part of the implementation of the following two new commands for L^AT_EX2e.

`\enlargethispage{<dim>}`

Adds <dim> to the height of the current column only. On the printed page the bottom of this column is extended downwards by exactly <dim> without having any effect on the placement of the footer; this may result in an overprinting.

`\enlargethispage*{<dim>}`

Similar to `\enlargethispage` but it tries to squeeze the column to be printed in as small a space as possible, ie it uses any shrinkability in the column. If the column was not explicitly broken (e.g. with `\pagebreak`) this may result in an overfull box message but except for this it will come out as expected (if you know what to expect).

The star form of this command is dedicated to Leslie Lamport, the other we need for ourselves (FMi, CAR).

These commands may well have unwanted effects if used soon before a `\clearpage`: please give keep them clear of such places.

`\@kludgeins` The insert which makes T_EX do a lot of the necessary work. All we need to put into it is the amount by which the pagegoal should be changed.

```
1852 \newinsert \@kludgeins
1853 \global\dimen\@kludgeins \maxdimen
1854 \global\count\@kludgeins 1000
```

`\enlargethispage` The user command.

```
\enlargethispage* 1855 \gdef \enlargethispage {%
1856   \ifstar
1857   {%
1858   (*trace)
1859     \fl@trace{Enlarging page height * }%
1860   </trace>
1861     \@enlargepage{\hbox{\kern\p@}}}%
1862   {%
1863   (*trace)
1864     \fl@trace{Enlarging page height exactly---}%
1865   </trace>
1866     \@enlargepage\@empty}%
1867 }
```

`\@enlargepage` This actually inserts the insert, after checking for extreme values of the change.

```
1868 \gdef\@enlargepage#1#2{%
1869 (*trace)
1870   \fl@trace{\@spaces\@spaces by #2}%
1871 </trace>
1872   \@tempskipa#2\relax
1873   \ifdim \@tempskipa>.5\maxdimen
```

```

1882     \@bsphack
1883     \insert\@kludgeins{#1\vskip-\@tempskipa}%
1884     \@esphack
    This next bit is for tracing only:
1885 (*trace)
1886     \ifvmode \par
1887     \fl@trace {Kludgeins added--pagegoal after: \the\pagegoal}%
1888     \fi
1889 (/trace)
1890   \else
1891     \@latexerr{Page\space height\space already\space
1892               too\space large}\@eha
1893   \fi
1894 \fi
1895 }
1896 (/2ekernel)

```

75.1.2 Float control

This part implements controllable floats and other changes to the float mechanism.

It provides, at the document level, the following command for inclusion in L^AT_EX2_ε.

```
\suppressfloats
```

This suppresses all further floats on the current page.

With an optional argument it suppresses only floats only in certain positions on the current page.

[t] suppresses only floats at the top of the page [b] suppresses only floats at the bottom of the page

It also enables the use of an extra specifier, !, in the location optional argument of a float. If this is present then, just for this particular float, whenever it is processed by the float mechanism the followinghg are ignored:

- all restrictions on the number of floats which can appear;
- all explicit restrictions on the amount of space which should (not) be occupied by floats and/or text.

The mechanism will still attempt to ensure that pages are not overfull.

These specifiers override, for the single float, the suppression commands described above.

In its current form, it also supplies a reasonably exhaustive, and somewhat baroque, means of tracing some aspects of the float mechanism.

More tracing.

```

\fl@trace Set-up tracing for floats independent of other tracing as it produces mega-output.
\tracefloatsoff Default is no tracing.

1985 }

```

Manipulation of float placement and type; both their strings and the corresponding count registers.

`\@fpstype` First a new count register to go with `\@currtype`.
`\@reqcolroom` Then a new skip register, for information needed to remove the `\@maxsep`
`\@textfloatsheight` conservatism: it is possible that this could use a temporary register.

Finally a dimension register to hold the total height of in-text floats on the current page. This is needed to implement a major change in the functionality of `\@addtocurcol` which is, nevertheless, a bug fix. It is not local and therefore cannot be a temporary register.

```

1986 \newcount \@fpstype
1987 \newdimen \@reqcolroom
1988 \newdimen \@textfloatsheight
1989 \if2kernel

```

`\@fpsadddefault` Adds the default placement to what is already there.
Should not need to change this, but could do it as follows:

```

\def \@fpsadddefault {%
  \temptokena \expandafter\expandafter\expandafter
    {\csname fps@\@captype \endcsname}%
  \edef \reserved@a {\the\temptokena}%
  \@onelevel@sanitize \reserved@a
  \edef \@fps {\@fps\reserved@a}%
}

```

```

2068   \fi
2069 }

```

Special stuff for BANG floats.

\@flsetnum Ignores any zero float counter value in case BANG.

It uses a local assignment to the normally global counter: a bit naughty, perhaps?

These assignments are safe so long as the counter involved is only consulted once (i.e. only for the ‘bang float’) with the changed value. This is the case within \@addtocurcol because it is used only once within a call of the output routine (which forms a group).

For \@addtonextcol this is achieved by putting a group around its code; this is needed because it is called (by \@startcolumn) for each float which was on the deferlist. Almost identical considerations pertain to \@addtodblcol. There may be more efficient ways to handle this, but the group seems to be the simplest.

```

2070 \def \@flsetnum #1{%
2071   (*trace)
2072     \fl@trace{fpstype: \the \@fpstype (flsetnum \string#1)}%

Interesting facts about float mechanisms past and present, together with a summary of various features, some unresolved:

1. The value `\textfraction` does not affect the processing of doublecol floats: this seems sensible, but should be documented.
2. `\twocolumn` floatplacement was wrong: `dbl` not needed, `ord` needed.
3. `\floatplacement` was not called after `\startdblcol` or `\topnewpage`. This has been changed; it is clearly a bug fix.
4. The use `\@topnewpage` when `\dblfigrule` is non-trivial produced a rule in the wrong place. This has been fixed by not using `\dblfigrule` when processing the ‘float’ from `\@topnewpage`.
5. If the specifier was just `h` and the float could not be put here, it went on the deferlist and stayed there until a clearpage. It now gets changed to a ‘th’: this is only an error-recovery action, putting just `h` or `!h` should be deprecated.
6. `\@dblmaxsep` was ‘the maximum of `\dblfloatsep` and `\dbltextfloatsep`’. But it was never used! Now gone completely, like `\@maxsep`.

7. After an h float is put on a page, it was counted as text when applying the `\textfraction` test; this is possibly too big a change although it is a bug fix?
8. Two consecutive h floats are separated by twice `\intertextsep`: this could be changed to one by use of `\addvspace`, OK? Note that it would also mean that less space is put in if an h float immediately follows other spaces. This is also possibly too big a change, at least for compatibility mode? Or it may be simply wrong! It has not been changed.
9. Now `\@addtocurcol` checks first for just p fps. I think that this is an increase in efficiency, but maybe the coding should be made even more efficient.
10. `\@tryfcolumn` now tests if the list is empty first, otherwise lots of wasted time! Thus this test has been removed from `\@startcolumn`. As Frank pointed out, this makes `\@startcolumn` less efficient. But it is now the same as `\@startdblcolumn`: I can see no reason why they should be different, but which is best?
11. Why is `\@colroom` set in `\@docclearpage`?
12. Footnotes. Check what `\clearpage` does when footnotes are left over. Footnotes are not put on float pages and, also, `\@addtonextcol` ignores the existence of held-over footnotes in deciding what floats can go on the page. Not changed.
13. `\clearpage` can still lose non-boxes, at least when floats are involved. It also moves some to the ‘wrong page’, but this may be a coding problem.
14. The `!` option makes it necessary to check in `\output` that there is enough room left on the page after adding a float. (This would have been necessary anyway if anyone set `\@textmin` too close to zero! A similar danger existed also if the text in a `\twocolumn[text]` entity gets too large.) The current implementation of this also makes the normal case a little less efficient, OK? Not enough room means, at present, less than `\baselineskip`, with a warning: is this OK? Should it be made generic (another parameter)?
15. There are four possibilities for supporting this:
`\twocolumn[\maketitle more text]`
 One is to change `\maketitle` slightly to allow this. Another is to change `\@topnewpage` so that more than one `\twocolumn[]` command is allowed; in this case `\maketitle\twocolumn[more text]` will work. The former is more robust from the user’s viewpoint, but makes the code for `\maketitle` rather ad hoc (maybe it is already?). Another is to misuse the global `twocolumn` flag locally within `\@topnewpage`. Yet another is to move the column count register from the `multicol` package into the kernel. This has been done.
16. Where should the reinserts be put to maximise the probability that footnotes come out on the correct page? Or should we go for as much compatibility as possible (but see next item)?

17. Should we continue to support (as much as possible) `\samepage`? Some of its intended functionality is now advertised as being provided by `\enlargethispage`. Use of either is likely to result in wrongly placed footnotes, marginals, etc. Which should have priority: obeying the pagination instructions, or correct placement of notes/marginalia?
18. Is the adjustment of space to cause shrinking in the kludge-* case correct? Should it be limited to 0pt?
19. Is the setting of `\boxmaxdepth` in `makecol` and friends needed? It only has any effect if `\@textbottom` ends with a box or rule, in which case the `vskip` to allow for its depth should also be added. If it is kept, it should probably be the last thing in the box. It has now been removed.

It would perhaps be better to document that `\@textbottom` and `\@texttop` must have natural height 0pt.
20. I cannot see why the `vskip` adjustment for the depth is needed if `boxmaxdepth` is used to ensure that there is never a too deep box.
21. The value of `\boxmaxdepth` should be explicitly set whenever necessary: it is too risky to assume that it has any particular value. Care is needed in deciding what to set it to.

It is interesting to note that the value of `\boxmaxdepth` is unique in being read before the local settings for the box group are reset; all other parameter settings which affect the box construction use their values outside the box group.
22. Should `\@maxdepth` store the setting of `\maxdepth` from `lplain`? Or should we provide a proper interface to class files for setting these?

An analysis of various other macros.

`\@opcol` should do `\@floatplacement`, but where? Right at the end, since it always occurs at the start of a column.

```
\def\@opcol{%
  % Why is this done first?
  \global \@mparbottom \z@
  \if@twocolumn
    \@outputdblcol
  \else
    \@outputpage
    % This is not needed since it is done at the end of
    %   |\@outputpage|:
    \global \@colht \textheight
  \fi}
```

Only tracing has been added to these.

75.1.3 Float placement parameters

The main purpose of this section is to ensure that all the float-placement parameters which need to be set in a class file or package have been declared. It

also describes their use and sets values for them which are reasonable for typical documents using US letter or A4 sized paper.

Limits for the placement of floating objects

<code>\c@topnumber</code>	This counter holds the maximum number of floats that can appear at the top of a text page or column. 2288 (*2ekernel) 2289 <code>\newcount\c@topnumber</code> 2290 <code>\setcounter{topnumber}{2}</code>
<code>\topfraction</code>	This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the top. 2291 <code>\newcommand\topfraction{.7}</code>
<code>\c@bottomnumber</code>	This counter holds the maximum number of floats that can appear at the bottom of a text page or column. 2292 <code>\newcount\c@bottomnumber</code> 2293 <code>\setcounter{bottomnumber}{1}</code>
<code>\bottomfraction</code>	This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the bottom. 2294 <code>\newcommand\bottomfraction{.3}</code>
<code>\c@totalnumber</code>	This counter holds the maximum number of floats that can appear on any text page or column. 2295 <code>\newcount\c@totalnumber</code> 2296 <code>\setcounter{totalnumber}{3}</code>
<code>\textfraction</code>	This macro holds the minimum proportion (as a decimal number) of a text page or column that must be occupied by text. 2297 <code>\newcommand\textfraction{.2}</code>
<code>\floatpagefraction</code>	This macro holds the minimum proportion (as a decimal number) of a page or column that must be occupied by floating objects before a ‘float page’ is produced. 2298 <code>\newcommand\floatpagefraction{.5}</code>
<code>\c@dbltopnumber</code>	This counter holds the maximum number of double-column floats that can appear on the top of a two-column text page. 2299 <code>\newcount\c@dbltopnumber</code> 2300 <code>\setcounter{dbltopnumber}{2}</code>
<code>\dbltopfraction</code>	This macro holds the maximum proportion (as a decimal number) of a two-column text page that can be occupied by double-column floats at the top. 2301 <code>\newcommand\dbltopfraction{.7}</code>
<code>\dblfloatpagefraction</code>	This macro holds the minimum proportion (as a decimal number) of a page that must be occupied by double-column floating objects before a ‘double-column float page’ is produced. 2302 <code>\newcommand\dblfloatpagefraction{.5}</code>

Floats on a text page

`\floatsep` When a floating object is placed on a page with text, these parameters control the separation between the float and the other objects on the page. These parameters are used for both one-column mode and single-column floats in two-column mode. They are all rubber lengths.

`\floatsep` is the space between adjacent floats that are placed at the top or bottom of the text page or column.

`\textfloatsep` is the space between the main text and floats at the top or bottom of the page or column.

`\intextsep` is the space between in-text floats and the text.

```
2303 \newskip\floatsep
2304 \newskip\textfloatsep
2305 \newskip\intextsep
2306 \setlength\floatsep {12\p@ \@plus 2\p@ \@minus 2\p@}
2307 \setlength\textfloatsep{20\p@ \@plus 2\p@ \@minus 4\p@}
2308 \setlength\intextsep {12\p@ \@plus 2\p@ \@minus 2\p@}
```

`\dblfloatsep` When double-column floats (floating objects that span the whole `\textwidth`) are placed at the top of a text page in two-column mode, the separation between the float and the text is controlled by `\dblfloatsep` and `\dbltextfloatsep`. They are rubber lengths.

`\dblfloatsep` is the space between adjacent double-column floats placed at the top of the text page.

`\dbltextfloatsep` is the space between the main text and double-column floats at the top of the page.

```
2309 \newskip\dblfloatsep
2310 \newskip\dbltextfloatsep
2311 \setlength\dblfloatsep {12\p@ \@plus 2\p@ \@minus 2\p@}
2312 \setlength\dbltextfloatsep{20\p@ \@plus 2\p@ \@minus 4\p@}
```

Floats on their own page or column

`\@fptop` When floating objects are placed on a separate page or column, called a ‘float page’, the layout of the page is controlled by these parameters, which are rubber lengths.

At the top of the page `\@fptop` is inserted; typically this supplies some stretchable whitespace. At the bottom of the page `\@fpbot` is inserted. Between adjacent floats `\@fpsep` is inserted.

These parameters are used for all floating objects on a ‘float page’ in one-column mode, and for single-column floats in two-column mode.

Note that at least one of the two parameters `\@fptop` and `\@fpbot` should contain a `plus ...fil` so as to fill the remaining empty space.

```
2313 \newskip\@fptop
2314 \newskip\@fpsep
2315 \newskip\@fpbot
2316 \setlength\@fptop{0\p@ \@plus 1fil}
2317 \setlength\@fpsep{8\p@ \@plus 2fil}
2318 \setlength\@fpbot{0\p@ \@plus 1fil}
```

`\@dblftop` Double-column ‘float pages’ in two-column mode use similar parameters.
`\@dblfpsep`
`\@dblfpbot`

```

2319 \newskip\@dblftop
2320 \newskip\@dblpsep
2321 \newskip\@dblpbot
2322 \setlength\@dblftop{0\p@ \@plus 1fil}
2323 \setlength\@dblpsep{8\p@ \@plus 2fil}
2324 \setlength\@dblpbot{0\p@ \@plus 1fil}

\topfigrule The macros can be used to put in rules between floats and text; whatever they
\botfigrule insert should be vertical mode material which takes up zero space.
\dblfigrule 2325 \let\topfigrule=\relax
2326 \let\botfigrule=\relax
2327 \let\dblfigrule=\relax
2328 \endkernel

```

File N

ltclass.dtx

76 Introduction

This file implements the following declarations, which replace `\documentstyle` in \LaTeX 2_ε documents.

Note that old documents containing `\documentstyle` will be run using a compatibility option—thus keeping everyone happy, we hope!

The overall idea is that there are two types of ‘style files’: ‘class files’ which define elements and provide a default formatting for them; and ‘packages’ which provide extra functionality. One difference between \LaTeX 2_ε and \LaTeX 2.09 is that \LaTeX 2_ε packages may have options. Note that options to classes/packages may be implemented such that they input files, but these file names are not necessarily directly related to the option name.

77 User interface

`\documentclass[⟨main-option-list⟩]{⟨class⟩}[⟨version⟩]`

There must be exactly one such declaration, and it must come first. The `⟨main-option-list⟩` is a list of options which can modify the formatting of elements which are defined in the `⟨class⟩` file as well as in all following `\usepackage` declarations (see below). The `⟨version⟩` is a version number, beginning with a date in the format `YYYY/MM/DD`. If an older version of the class is found, a warning is issued.

`\documentstyle[⟨main-option-list⟩]{⟨class⟩}[⟨version⟩]`

The `\documentstyle` declaration is kept in order to maintain upward compatibility with \LaTeX 2.09 documents. It is similar to `\documentclass`, but it causes all options in `⟨main-option-list⟩` that the `⟨class⟩` does not use to be passed to `\RequirePackage` after the options have been processed. This maintains compatibility with the 2.09 behaviour. Also a flag is set to indicate that the document is to be processed in \LaTeX 2.09 compatibility mode. As far as most packages are concerned, this only affects the warnings and errors \LaTeX generates. This flag does affect the definition of font commands, and `\sloppy`.

`\usepackage[⟨package-option-list⟩]{⟨package-list⟩}[⟨version⟩]`

There can be any number of these declarations. All packages in `⟨package-list⟩` are called with the same options.

Each `⟨package⟩` file defines new elements (or modifies those defined in the `⟨class⟩`), and thus extends the range of documents which can be processed. The `⟨package-option-list⟩` is a list of options which can modify the formatting of elements defined in the `⟨package⟩` file. The `⟨version⟩` is a version number, beginning with a date in the format `YYYY/MM/DD`. If an older version of the package is found, a warning is issued.

Each package is loaded only once. If the same package is requested more than once, nothing happens, unless the package has been requested with options that were not given the first time it was loaded, in which case an error is produced.

As well as processing the options given in the $\langle package-option-list \rangle$, each package processes the $\langle main-option-list \rangle$. This means that options that affect all of the packages can be given globally, rather than repeated for every package.

Note that class files have the extension `.cls`, packages have the extension `.sty`.

`filecontents`

The environment `filecontents` is intended for passing the contents of packages, options, or other files along with a document in a single file. It has one argument, which is the name of the file to create. If that file already exists (maybe only in the current directory if the OS supports a notion of a ‘current directory’ or ‘default directory’) then nothing happens (except for an information message) and the body of the environment is bypassed. Otherwise, the body of the environment is written verbatim to the file name given as the first argument, together with some comments about how it was produced.

The environment can also be called with an optional argument which is used to alter some of its behavior: option `force` or `overwrite` will allow for overwriting existing files, option `nosearch` will only check the current directory when looking if the file exists. This can be useful if you want to generate a local (modified) copy of some file that is already in the search tree of \TeX . Finally, you can use `nopreamble` to prevent it from writing the standard blurb at the top of the file (this is actually the same as using the star form of the environment).

The environment is now allowed anywhere in the document, but to ensure that all packages or options necessary are available when the document is run, it is normally best to place it at the top of your file (before `\documentclass`). A possible use case for using it inside the document body is if you want to reuse some text several times in the document you could then write it and later use `\input` to retrieve it where needed.

The begin and end tags should each be on a line by itself.

77.1 Option processing

When the options are processed, they are divided into two types: *local* and *global*:

- For a class, the options in the `\documentclass` command are local.
- For a package, the options in the `\usepackage` command are local, and the options in the `\documentclass` command are global.

The options for `\documentclass` and `\usepackage` are processed in the following way:

1. The local and global options that have been declared (using `\DeclareOption` as described below) are processed first.

In the case of `\ProcessOptions`, they are processed in the order that they were declared in the class or package.

In the case of `\ProcessOptions*`, they are processed in the order that they appear in the option-lists. First the global options, and then the local ones.

2. Any remaining local options are dealt with using the default option (declared using the `\DeclareOption*` declaration described below). For document classes, this usually does nothing, but records the option on a list of unused options. For packages, this usually produces an error.

Finally, when `\begin{document}` is reached, if there are any global options which have not been used by either the class or any package, the system will produce a warning.

78 Class and Package interface

78.1 Class name and version

`\ProvidesClass` A class can identify itself with the `\ProvidesClass{<name>}[<version>]` command. The `<version>` should begin with a date in the format `YYYY/MM/DD`.

78.2 Package name and version

`\ProvidesPackage` A package can identify itself with the `\ProvidesPackage{<name>}[<version>]` command. The `<version>` should begin with a date in the format `YYYY/MM/DD`.

78.3 Requiring other packages

`\RequirePackage` Packages or classes can load other packages using `\RequirePackage[<options>]{<name>}[<version>]`. If the package has already been loaded, then nothing happens unless the requested options are not a subset of the options with which it was loaded, in which case an error is called.

`\LoadClass` Similar to `\RequirePackage`, but for classes, may not be used in package files.
`\PassOptionsToPackage` Packages can pass options to other packages using:

`\PassOptionsToPackage{<options>}{<package>}`.

`\PassOptionsToClass` This adds the `<options>` to the options list of any future `\RequirePackage` or `\usepackage` command. For example:

```
\PassOptionsToPackage{foo,bar}{fred}
\RequirePackage[baz]{fred}
```

is the same as:

```
\RequirePackage[foo,bar,baz]{fred}
```

`\LoadClassWithOptions` `\LoadClassWithOptions{<name>}[<version>]:`

This is similar to `\LoadClass`, but it always calls class `<name>` with exactly the same option list that is being used by the current class, rather than an option explicitly supplied or passed on by `\PassOptionsToClass`.

`\RequirePackageWithOptions` `\RequirePackageWithOptions` is the analogous command for packages.

This is mainly intended to allow one class to simply build on another, for example:

```
\LoadClassWithOptions{article}
```

This should be contrasted with the slightly different construction

```
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

As used here, the effects are more or less the same, but the version using `\LoadClassWithOptions` is slightly quicker (and less to type). If, however, the class declares options of its own then the two constructions are different; compare, for example:

```
\DeclareOption{landscape}{...}
\ProcessOptions
\LoadClassWithOptions{article}
```

with:

```
\DeclareOption{landscape}{...}
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

In the first case, the `article` class will be called with option `landscape` precisely when the current class is called with this option; but in the second example it will not as in that case `article` is only passed options by the default option handler, which is not used for `landscape` as that option is explicitly declared.

<pre>\@ifpackageloaded \@ifclassloaded \@ifpackagelater \@ifclasslater \@ifpackagewith \@ifclasswith</pre>	<p>To find out if a package has already been loaded, use</p> <pre>\@ifpackageloaded{<package>}{<true>}{<false>}.</pre> <p>To find out if a package has already been loaded with a version equal to or more recent than <code><version></code>, use</p> <pre>\@ifpackagelater{<package>}{<version>}{<true>}{<false>}.</pre> <p>To find out if a package has already been loaded with at least the options <code><options></code>, use <code>\@ifpackagewith{<package>}{<options>}{<true>}{<false>}</code>.</p>
--	---

There exists one package that can't be tested with the above commands: the `fontenc` package pretends that it was never loaded to allow for repeated reloading with different options (see `ltoutenc.dtx` for details).

78.4 Declaring new options

Options for classes and packages are built using the same macros.

<pre>\DeclareOption \DeclareOption*</pre>	<p>To define a builtin option, use <code>\DeclareOption{<name>}{<code>}</code>.</p> <p>To define the default action to perform for local options which have not been declared, use <code>\DeclareOption*{<code>}</code>.</p>
---	--

Note: there should be no use of

`\RequirePackage`, `\DeclareOption`, `\DeclareOption*` or `\ProcessOptions` inside `\DeclareOption` or `\DeclareOption*`.

Possible uses for `\DeclareOption*` include:

```
\DeclareOption*{}
```

Do nothing. Silently accept unknown options. (This suppresses the usual warnings.)

```
\DeclareOption*{\@unknownoptionerror}
```

Complain about unknown local options. (The initial setting for package files.)

```
\DeclareOption*{\PassOptionsToPackage{\CurrentOption}{<pkg-name>}}
```

Handle the current option by passing it on to the package `<pkg-name>`, which will presumably be loaded via `\RequirePackage` later in the file. This is useful for building 'extension' packages, that perhaps handle a couple of new options, but then pass everything else on to an existing package.

```

\DeclareOption*{\InputIfFileExists{xx-\CurrentOption.yyy}%
{}%
{\OptionNotUsed}}

```

Handle the option foo by loading the file `xx-foo.yyy` if it exists, otherwise do nothing, but declare that the option was not used. Actually the `\OptionNotUsed` declaration is only needed if this is being used in class files, but does no harm in package files.

78.5 Safe Input Macros

<code>\InputIfFileExists</code>	<code>\InputIfFileExists{<file>}{<then>}{<else>}</code> Inputs <code><file></code> if it exists. Immediately before the input, <code><then></code> is executed. Otherwise <code><else></code> is executed.
<code>\IfFileExists</code>	As above, but does not input the file. One thing you might like to put in the <code><else></code> clause is
<code>\@missingfileerror</code>	This starts an interactive request for a filename, supplying default extensions. Just hitting return causes the whole input to be skipped and entering <code>x</code> quits the current run,
<code>\input</code>	This has been redefined from the L ^A T _E X2.09 definition, in terms of the new commands <code>\InputIfFileExists</code> and <code>\@missingfileerror</code> .
<code>\listfiles</code>	Giving this declaration in the preamble causes a list of all files input via the ‘safe input’ commands to be listed at the end. Any strings specified in the optional argument to <code>\ProvidesPackage</code> are listed alongside the file name. So files in standard (and other non-standard) distributions can put informative strings in this argument.

79 Implementation

```

1 (*2kernel)

\if@compatibility The flag for compatibility mode.
2 \newif\if@compatibility

\@documentclasshook The hook called after the first \documentclass command. By default this checks
to see if \@normalsize is undefined, and if so, sets it to \normalsize.
3 \def\@documentclasshook{%
4   \ifx\@normalsize\undefined
5     \let\@normalsize\normalsize
6   \fi
7 }

\@declaredoptions This list is automatically built by \DeclareOption. It is the list of options (separated by commas) declared in the class or package file and it defines the order in which the the corresponding \ds@<option> commands are executed. All local <option>s which are not declared will be processed in the order defined by the optional argument of \documentclass or \usepackage.
8 \let\@declaredoptions\@empty

\@classoptionslist List of options of the main class.
9 \let\@classoptionslist\relax
10 \onlypreamble\@classoptionslist

```

<code>\@unusedoptionlist</code>	List of options of the main class that haven't been declared or loaded as class option files. 11 <code>\let\@unusedoptionlist\@empty</code> 12 <code>\@onlypreamble\@unusedoptionlist</code>
<code>\CurrentOption</code>	Name of current package or option. 13 <code>\let\CurrentOption\@empty</code>
<code>\@currname</code>	Name of current package or option. 14 <code>\let\@currname\@empty</code>
<code>\@currentx</code>	The current file extension. 15 <code>\global\let\@currentx=\@empty</code>
<code>\@clsextension</code>	The two possible values of <code>\@currentx</code> .
<code>\@pkgextension</code>	16 <code>\def\@clsextension{cls}</code> 17 <code>\def\@pkgextension{sty}</code> 18 <code>\@onlypreamble\@clsextension</code> 19 <code>\@onlypreamble\@pkgextension</code>
<code>\@pushfilename</code>	Commands to push and pop the file name and extension.
<code>\@popfilename</code>	#1 current name.
<code>\@currnamestack</code>	#2 current extension. #3 current catcode of @. #4 Rest of the stack. 20 <code>\def\@pushfilename{%</code> 21 <code> \xdef\@currnamestack{%</code> 22 <code> {\@currname}%</code> 23 <code> {\@currentx}%</code> 24 <code> {\the\catcode'\@}%</code> 25 <code> \@currnamestack}}</code> 26 <code>\@onlypreamble\@pushfilename</code> 27 <code>\def\@popfilename{\expandafter\@p@pfilename\@currnamestack\@nil}</code> 28 <code>\@onlypreamble\@popfilename</code> 29 <code>\def\@p@pfilename#1#2#3#4\@nil{%</code> 30 <code> \gdef\@currname{#1}%</code> 31 <code> \gdef\@currentx{#2}%</code> 32 <code> \catcode'\@#3\relax</code> 33 <code> \gdef\@currnamestack{#4}}</code> 34 <code>\@onlypreamble\@p@pfilename</code> 35 <code>\gdef\@currnamestack{}</code> 36 <code>\@onlypreamble\@currnamestack</code>
<code>\@optionlist</code>	Returns the option list of the file. 37 <code>\def\@optionlist#1{%</code> 38 <code> @ifundefined{opt@#1}\@empty{\csname opt@#1\endcsname}}</code> 39 <code>\@onlypreamble\@optionlist</code>
<code>\@ifpackageloaded</code>	<code>\@ifpackageloaded{<name>}</code> Checks to see whether a file has been loaded.
<code>\@ifclassloaded</code>	40 <code>\def\@ifpackageloaded{\@ifl@aded\@pkgextension}</code> 41 <code>\def\@ifclassloaded{\@ifl@aded\@clsextension}</code> 42 <code>\@onlypreamble\@ifpackageloaded</code> 43 <code>\@onlypreamble\@ifclassloaded</code>

```

44 \def\@ifl@aded#1#2{%
45   \expandafter\ifx\csname ver@#2.#1\endcsname\relax
46     \expandafter\@secondoftwo
47   \else
48     \expandafter\@firstoftwo
49   \fi}
50 \@onlypreamble\@ifl@aded

\@ifpackagelater \@ifpackagelater{\<name>}{YYYY/MM/DD} Checks that the package loaded is
\@ifclasslater more recent than the given date.

51 \def\@ifpackagelater{\@ifl@ter\@pkgextension}
52 \def\@ifclasslater{\@ifl@ter\@clsextension}

```

`\OptionNotUsed` If we are in a class file, add `\CurrentOption` to the list of unused options. Otherwise, in a package file do nothing.

```
218 \def\OptionNotUsed{%
219   \ifx\@current\@clsextension
220     \xdef\@unusedoptionlist{%
221       \ifx\@unusedoptionlist\@empty\else\@unusedoptionlist,\fi
222       \CurrentOption}%
223   \fi}
224 \@onlypreamble\OptionNotUsed
```

`\default@ds` The default option code. Set by `\@onefilewithoptions` to either `\OptionNotUsed` for classes, or `\@unknownoptionerror` for packages. This may be reset in either case with `\DeclareOption*`.

```
225 % \let\default@ds\OptionNotUsed
```

`\ProcessOptions` `\ProcessOptions` calls `\ds@option` for each known package option, then calls `\default@ds` for each option on the local options list. Finally resets all the declared options to `\relax`. The empty option does nothing, this has to be reset on the off chance it's set to `\relax` if an empty element gets into the `\@declaredoptions` list.

The star form is similar but executes options given in the order specified in the document, not the order they are declared in the file. In the case of packages, global options are executed before local ones.

```

Then we do some work.

First of all, we define the global variables. Then we look to see if the file has already been loaded. If it has, we check that it was first loaded with at least the current options. If it has not, we add the current options to the package options, set the default version to be 0000/00/00, and load the file if we can find it. Then we check the version number.

Finally, we restore the old file name, reset the default option, and we set the catcode of `@`.

For classes, we can immediately process the file. For other types, `#2` could be a comma separated list, so loop through, processing each one separately.

80 Package/class rollback mechanism

```

812 \endgroup
813 (*2ekernel | latexreleasefirst)

```

`\pkgcls@debug` For testing we have a few extra lines of code that by default do nothing but one can set `\pkgcls@debug` to `\typeout` to get extra info. Sometime in the future this will be dropped.

```

814 (*tracerollback)
815 %\let\pkgcls@debug\typeout
816 \let\pkgcls@debug\@gobble
817 \endgroup

```

`\requestedLaTeXdate` The macro (!) `\requestedLaTeXdate` holds the globally requested rollback date (via `latexrelease`) or zero if no such request was made.

```

818 \def\requestedLaTeXdate{0}

```

`\pkgcls@targetdate` If a rollback for a package or class is requested then `\pkgcls@targetdate` holds the requested date as a number YYYYMMDD (if there was one, otherwise the value of `\requestedLaTeXdate`) and `\pkgcls@targetlabel` will be empty. If there was a request for a named version then `\pkgcls@targetlabel` holds the version name and `\pkgcls@targetdate` is set to 1.

`\pkgcls@targetdate=0` is used to indicate that there was no rollback request. While loading an old release `\pkgcls@targetdate` is also reset to zero so that `\DeclareRelease` declarations are bypassed.

In contrast `\pkgcls@innerdate` will always hold the requested date (in a macro not a counter) if there was one, otherwise, e.g., if there was no request or a request to a version name it will contain T_EX largest legal number. While loading a file this can be used to provide conditionals that select code based on the request.

```
819 \ifx\pkgcls@targetdate\@undefined
820   \newcount\pkgcls@targetdate
821 \fi
822 \let\pkgcls@targetlabel\@empty
823 \def\pkgcls@innerdate{\maxdimen}
```

`\pkgcls@candidate` When looping through the `\DeclareRelease` declarations we record if the release
`\pkgcls@releasedate` is the best candidate we have seen so far. This is recorded in `\pkgcls@candidate` and we update it whenever we see a better one.

In `\pkgcls@releasedate` we keep track of the release date of that candidate.

```
824 \let\pkgcls@candidate\@empty
825 \let\pkgcls@releasedate\@empty
```

`\load@onefilewithoptions` the best place to add the rollback code is at the point where `\@onefilewithoptions`
`\@onefilewithoptions` is called to load a single class or package.

To make things easy we save the old definition as `\load@onefilewithoptions` and then provide a new interface.

Important: as this code is also unconditionally placed into `latexrelease` we can only do this name change once otherwise both macros will contain the same code.

```
826 \ifx\load@onefilewithoptions\@undefined
827   \let\load@onefilewithoptions\@onefilewithoptions
828   \def\@onefilewithoptions#1[#2][#3]#4{%
```

First a bit of tracing normally disabled.

```
829 (*tracerollback)
830   \pkgcls@debug{--- File loaded request (\noexpand\usepackage or ...)}%
831   \pkgcls@debug{\@spaces 1: #1}%
832   \pkgcls@debug{\@spaces 2: #2}%
833   \pkgcls@debug{\@spaces 3: #3}%
834   \pkgcls@debug{\@spaces 4: #4}%
835 </tracerollback>
```

Two of the arguments are needed later on in error/warning messages so we save them.

```
836   \def\pkgcls@name{#1}%           % for info message
837   \def\pkgcls@arg {#3}%           % for info message
```

then we parse the final optional argument to determine if there is a specific rollback request for the current file. This will set `\pkgcls@targetdate`, `\pkgcls@targetlabel` and `\pkgcls@mindate`.

```
838   \pkgcls@parse@date@arg{#3}%
```

When determining the correct release to load we keep track of candidates in `\pkgcls@candidate` and initially we don't have any:

```
839   \let\pkgcls@candidate\@empty
```

If we had a rollback request then `#3` may contain data but not necessarily a “minimal date” so instead of passing it on we pass on the content of `\pkgcls@mindate`.

We need to pass the value not the command, otherwise nested packages may pick up the wrong information.

```

840 \begingroup
841 \edef\reserved@a{%
842 \endgroup
843 \unexpanded{\load@onefilewithoptions#1[#2]}%
844 [\pkgcls@mindate]%
845 \unexpanded{#4}}%
846 \reserved@a
847 }
848 \fi

```

`\pkgcls@parse@date@arg` The `\pkgcls@parse@date@arg` command parses the second optional argument of `\usepackage`, `\RequirePackage` or `\documentclass` for a rollback request setting the values of `\pkgcls@targetdate` and `\pkgcls@targetlabel`.

This optional argument has a dual purpose: If it just contains a date string then this means that the package should have at least that date (to ensure that a certain feature is actually available, or a certain bug has been fixed). When the package gets loaded the information in `\Provides...` will then be checked against this request.

But if it starts with an equal sign followed by a date string or followed by a version name then this means that we should roll back to the state of the package at the date or to the version with the requested name.

If there was no optional argument or the optional argument does not start with “=” then the `\pkgcls@targetdate` is set to the date of the overall rollback request (via `latexrelease`) or if that was not given it is set to 0. In either case `\pkgcls@targetlabel` will be made empty.

If the argument doesn’t start with “=” then it is supposed to be a “minimal date” and we therefore save the value in `\pkgcls@mindate`, otherwise this macro is made empty.

So in summary we have:

Input	<code>\pkgcls@targetdate</code>	<code>\pkgcls@targetlabel</code>	<code>\pkgcls@mindate</code>
<code><empty></code>	→ <code><global-rollbackdate-as-number></code>	<code><empty></code>	<code><empty></code>
<code><date></code>	→ <code><global-rollbackdate-as-number></code>	<code><empty></code>	<code><date></code>
<code>=<date></code>	→ <code><date-as-number></code>	<code><empty></code>	<code><empty></code>
<code>=<version></code>	→ 1	<code><version></code>	<code><empty></code>
<code><other></code>	→ <code><global-rollbackdate-as-number></code>	<code><empty></code>	<code><other></code>

where `<global-rollbackdate-as-number>` is a date request given via `latexrelease` or if there wasn’t one 0.

```

849 \def\pkgcls@parse@date@arg #1{%

```

If the argument is empty we use the rollback date from `latexrelease` which has the value of zero if there was no rollback request. The label and the minimal date is made empty in that case.

```

850 \ifx\@nil#1\@nil
851 \pkgcls@targetdate\requestedLaTeXdate\relax
852 \let\pkgcls@targetlabel\@empty
853 \let\pkgcls@mindate\@empty

```

Otherwise we parse the argument further, checking for a = as the first character. We append a = at the end so that there is at least one such character in the argument.

```
854 \else
855 \pkgcls@parse@date@arg@#1=\@nil\relax
856 \fi
857 }
```

The actual parsing work then happens in `\pkgcls@parse@date@arg@`:

```
858 \def\pkgcls@parse@date@arg@#1=#2\@nil{%
```

We set `\pkgcls@targetdate` depending on the parsing result; the code is expandable so we can do the parsing as part of the assignment.

```
859 \pkgcls@targetdate
```

If a = was in first position then #1 will be empty. In that case #2 will be the original argument with a = appended.

This can be parsed with `\@parse@version`, the trailing character is simply ignored. This macro returns the parsed date as a number (or zero if it wasn't a date) and accepts both YYYY/MM/DD and YYYY-MM-DD formats.

```
860 \ifx\@nil#1\@nil
861 \@parse@version0#2//00\@nil\relax
```

Whatever is returned is thus assigned to `\pkgcls@targetdate` and therefore we can now test its value. If the value is zero we assume that the remaining argument string represents a version and change `\pkgcls@targetdate` and set `\pkgcls@targetlabel` to the version name (after stripping off the trailing =).

```
862 \ifnum \pkgcls@targetdate=\z@
863 \pkgcls@targetdate\@ne
864 \def\pkgcls@innerdate{\maxdimen}%
865 \pkgcls@parse@date@arg@version#2%
866 \else
867 \edef\pkgcls@innerdate{\the\pkgcls@targetdate}%
868 \fi
869 \let\pkgcls@mindate\@empty
870 \else
```

If #1 was not empty then there wasn't a = character in first position so we are dealing either with a "minimum date" or with some incorrect data. We assume the former and make the following assignments (the first one finishing the assignment of `\pkgcls@targetdate`):

```
871 \requestedLaTeXdate\relax
872 \let\pkgcls@targetlabel\@empty
873 \def\pkgcls@innerdate{\maxdimen}%
874 \def\pkgcls@mindate{#1}%
```

If the min-date is after the requested rollback date (if there is any, i.e., if it is not zero) then we have a conflict and therefore issue a warning.

```
875 \ifnum \pkgcls@targetdate > \z@
876 \ifnum \@parse@version0#1//00\@nil > \pkgcls@targetdate
877 \@latex@warning@no@line{Suspicious rollback/min-date date given\MessageBreak
878 A minimal date of #1 has been specified for
879 \@cls@pkg\MessageBreak '\pkgcls@name'.\MessageBreak
880 But this is in conflict
881 with a rollback request to \requestedpatchdate}
```

```

882         \fi
883     \fi
884 \fi
885 }

```

Strip off the trailing = and assign the version name to `\pkgcls@targetlabel`.

```

886 \def\pkgcls@parse@date@arg@version#1={%
887   \def\pkgcls@targetlabel{#1}}

```

\DeclareRelease First argument is the “name” of the release and it can be left empty if one doesn’t like to give a name to the release. The second argument is that from which on this release was available (or should be used in case of minor updates). The final argument is the external file name of this release, by convention this should be `<pkg/cls-name>-<date>.<extension>` but this is not enforced and through this argument one can overwrite it.

```

888 \def\DeclareRelease#1#2#3{%
889   \ifnum\pkgcls@targetdate>\z@ % some sort of rollback request
890 (*tracerollback)
891   \pkgcls@debug{---\string\DeclareRelease:}%
892   \pkgcls@debug{\@spaces 1: #1}%
893   \pkgcls@debug{\@spaces 2: #2}%
894   \pkgcls@debug{\@spaces 3: #3}%
895 /tracerollback)

```

If the date argument #2 is empty we are dealing with a special release that should be only accessible via its name; a typical use case would be a “beta” release. So if we are currently processing a date request we ignore it and otherwise we check if we can match the name and if so load the corresponding release file.

```

896   \ifx\@nil#2\@nil
897     \ifnum\pkgcls@targetdate=\@ne % named request
898       \def\reserved@a{#1}%
899       \ifx\pkgcls@targetlabel\reserved@a
900         \pkgcls@use@this@release{#3}{}%
901 (*tracerollback)
902       \else
903         \pkgcls@debug{Label doesn't match}%
904 /tracerollback)
905     \fi
906 (*tracerollback)
907   \else
908     \pkgcls@debug{Date request: ignored}%
909 /tracerollback)
910   \fi
911 \else

```

If the value of `\pkgcls@targetdate` is greater than 1 (or in reality greater than something like 19930101) we are dealing with a rollback request to a specific date.

```

912   \ifnum\pkgcls@targetdate>\@ne % a real request

```

So we parse the date of this release to check if it is before or after the request date.

```

913   \ifnum\@parse@version#2//00\@nil
914     >\pkgcls@targetdate

```

If it is after we have to distinguish between two cases: If there was an earlier candidate we use that one because the other is too late, but if there wasn’t one

(i.e., if current release is the oldest that exists) we use it as the best choice. However in that case something is wrong (as there shouldn't be a rollback to a date where a package used doesn't yet exists. So we make a complained to the user.

```

915         \ifx\pkgcls@candidate\@empty
916             \pkgcls@rollbackdate@error{#2}%
917             \pkgcls@use@this@release{#3}{#2}%
918         \else
919             \pkgcls@use@this@release\pkgcls@candidate
920                                     \pkgcls@releasedate
921         \fi
922     \else

```

Otherwise, if the release date of this version is before the target rollback and we record it as a candidate. But we don't use it yet as there may be another release which is still before the target rollback.

```

923         \def\pkgcls@candidate{#3}%
924         \def\pkgcls@releasedate{#2}%
925 (*tracerollback)
926         \pkgcls@debug{New candidate: #3}%
927 (/tracerollback)
928     \fi
929 \else

```

If we end up in this branch we have a named version request. So we check if `\pkgcls@targetlabel` matches the current name and if yes we use this release immediately, otherwise we do nothing as a later declaration may match it.

```

930     \def\reserved@a{#1}%
931     \ifx\pkgcls@targetlabel\reserved@a
932         \pkgcls@use@this@release{#3}{#2}%
933 (*tracerollback)
934     \else
935         \pkgcls@debug{Label doesn't match}%
936 (/tracerollback)
937     \fi
938 \fi
939 \fi
940 \fi
941 }

```

`\pkgcls@use@this@release` If a certain release has been selected (stored in the external file given in #1) we need to input it and afterwards stop reading the current file.

```

942 \def\pkgcls@use@this@release#1#2{%

```

Before that we record the selection made inside the transcript.

```

943     \pkgcls@show@selection{#1}{#2}%

```

We then set the `\pkgcls@targetdate` to zero so that any `\DeclareRelease` or `\DeclareCurrentRelease` in the file we now load are bypassed¹² and then we finally load the correct release.

¹²The older release may also have such declarations inside if it was a simply copy of the `.sty` or `.cls` file current at that date. Removing these declarations would make the file load a tiny bit faster, but this way it works in any case.

After loading that file we need to stop reading the current file so we issue `\endinput`. Note that the `\relax` before that is essential to ensure that the `\endinput` is only happening after the file has been fully processed, otherwise it would act after the first line of the `\@@input`!

```
944 \pkgcls@targetdate\z@
945 \@@input #1\relax
946 \endinput
947 }
```

`\pkgcls@show@selection` This command records what selection was made. As that is needed in two places (and it is rather lengthy) it was placed in a separate command. The first argument is the name of the external file that is being loaded and is only needed for debugging. The second argument is the date that corresponds to this file and it is used as part of the message.

```
948 \def\pkgcls@show@selection#1#2{%
949 (*tracereollback)
950 \pkgcls@debug{Result: use #1}%
951 /tracereollback)
952 \GenericInfo
953 {\@spaces\@spaces\space}{Rollback for
954 \@cls@pkg\space'\@currname' requested ->
955 \ifnum\pkgcls@targetdate>\@ne
956 date
957 \ifnum\requestedLaTeXdate=\pkgcls@targetdate
958 \requestedpatchdate
959 \else
960 \expandafter\@gobble\pkgcls@arg
961 \fi.\MessageBreak
```

Instead of “best approximation” we could say that we have been able to exactly match the date (if it is exact), but that would mean extra tests without much gain, so not done.

```
962 Best approximation is
963 \else
964 version '\pkgcls@targetlabel'.\MessageBreak
965 This corresponds to
966 \fi
967 \ifx\@nil#2\@nil
968 a special release%
969 \else
970 the release introduced on #2%
971 \fi
972 \@gobble}%
973 }
```

`\pkgcls@rollbackdate@error` This is called if the requested rollback date is earlier than the earliest known release of a package or class.

A similar error is given if global rollback date and min-date on a specific package conflict with each other, but that case is happens only once so it is inlined.

```
974 \def\pkgcls@rollbackdate@error#1{%
975 \latex@error{Suspicious rollback date given}%
976 {The \@cls@pkg\space'\@currname' claims that it
977 came into existence on #1 which\MessageBreak
```

```

978      is after your requested rollback date --- so
979      something is wrong here.\MessageBreak
980      Continue and we use the earliest known release.}}

```

`\DeclareCurrentRelease` This declares the date (and possible name) of the current version of a package or class.

```

981 \def\DeclareCurrentRelease#1#2{%

```

First we test if `\pkgcls@targetdate` is greater than zero, otherwise this code is bypassed (as there is no rollback request).

```

982   \ifnum\pkgcls@targetdate>\z@ % some sort of rollback request
983   (*trac.rollback)
984   \pkgcls@debug{---DeclareCurrentRelease}%
985   \pkgcls@debug{ 1: #1}%
986   \pkgcls@debug{ 2: #2}%
987   /trac.rollback)

```

If the value is greater than 1 we have to deal with a date request, so we parse `#2` as a date and compare it with `\pkgcls@targetdate`.

```

988   \ifnum\pkgcls@targetdate>\@ne % a date request
989   \ifnum\@parse@version#2//00\@nil
990       >\pkgcls@targetdate

```

If it is greater that means the release date if this file is later than the requested rollback date. Again we have two cases: If there was a previous candidate release we use that one as the current release is too young, but if there wasn't we have to use this release nevertheless as there isn't any alternative.

However this case can only happen if there is a `\DeclareCurrentRelease` but no declared older releases (so basically the use of the declaration is a bit dubious).

```

991   \ifx\pkgcls@candidate\@empty
992   \pkgcls@rollbackdate@error{#2}%
993   \else
994   \pkgcls@use@this@release\pkgcls@candidate
995   \pkgcls@releasedate
996   \fi

```

Otherwise the current file is the right release, so we record that in the transcript and then carry on.

```

997   \else
998   \pkgcls@show@selection{current version}{#2}%
999   \fi
1000  \else % a label request

```

Otherwise we have a rollback request to a named version so we check if that fits the current name and if not give an error as this was the last possible opportunity.

```

1001   \def\reserved@a{#1}%
1002   \ifx\pkgcls@targetlabel\reserved@a
1003   \pkgcls@show@selection{current version}{#2}%
1004   \else
1005   \@latex@error{Requested version '\pkgcls@targetlabel' for
1006   \cls@pkg\space'\@currname' is unknown}\@ehc
1007   \fi
1008   \fi
1009 \fi
1010 }

```

`\IfTargetDateBefore` This enables a simple form of conditional code inside a class or package file. If there is a date request and the request date is earlier than the first argument the code in the second argument is processed otherwise the code in the third argument is processed. If there was no date request then we also execute the third argument, i.e., we will get the “latest” version of the file.

Most often the second argument (before-date-code) will be empty.

```

1011 \DeclareRobustCommand\IfTargetDateBefore[1]{%
1012   \ifnum\pkgcls@innerdate <%
1013     \expandafter\@parse@version\expandafter0#1//00\@nil
1014     \typeout{Exclude code introduced on #1}%
1015     \expandafter\@firstoftwo
1016   \else
1017     \typeout{Include code introduced on #1}%
1018     \expandafter\@secondoftwo
1019   \fi
1020 }

1021 </2ekernel | latexreleasefirst>

```

81 After Preamble

Finally we declare a package that allows all the commands declared above to be `\@onlypreamble` to be used after `\begin{document}`.

```

1022 <*/afterpreamble>
1023 \NeedsTeXFormat{LaTeX2e}
1024 \ProvidesPackage{pkgindoc}
1025   [1994/10/20 v1.1 Package Interface in Document (DPC)]
1026 \def\reserved@a#1\do\@classoptionslist#2\do\filecontents#3\relax{%
1027   \gdef\@preamblecmds{#1#3}}
1028 \expandafter\reserved@a\@preamblecmds\relax
1029 </afterpreamble>

```

File O

lthyphen.dtx

This file contains the code for loading hyphenation patterns into L^AT_EX. Most of this will end up in a file called `hyphen.ltx`. If you wish to customize your L^AT_EX system in respect of hyphenation patterns, write a file `hyphen.cfg`. If this file exists, it will be loaded instead of `hyphen.ltx`. See the comments below for additional information.

To produce the printed version of this file the following code is used. It can be extracted with the DOCSTRIP program, or one can run this file directly through L^AT_EX 2_ε.

```
1 (*driver)
2 \documentclass{ltxdoc}
3 \begin{document}
4 \DocInput{lthyphen.dtx}
5 \end{document}
6 \</driver>
```

The default file `hyphen.ltx` loads hyphenation patterns for US english. If you want to load additional or other hyphenation patterns, you should create a file `hyphen.cfg`. This is best done by starting from `hyphen.ltx`.

For backward compatibility, the default file, `hyphen.ltx`, first tries to load the file `hyphen.tex`. If this file exists, an information message is issued and the appropriate defaults for T_EX's internal parameters are set: `\language` is initialized to 0, and `\lefthyphenmin` and `\righthyphenmin` to 2 and 3, respectively, to disallow x- or -xx breaks.

```
7 (*default)
8 \InputIfFileExists{hyphen.tex}%
9   {\message{Loading hyphenation patterns for US english.}}%
10   \language=0
11   \lefthyphenmin=2 \righthyphenmin=3 }%
```

Otherwise, since we cannot do anything without any hyphenation patterns, an error message is printed and the IniT_EX run is terminated by invoking `\@@end` (which is the L^AT_EX 2_ε name for T_EX's `\end` primitive).

```
12   {\errhelp{The configuration for hyphenation is incorrectly
13             installed.^^J%
14             If you don't understand this error message you need
15             to seek^^Jexpert advice.}%
16   \errmessage{OOPS! I can't find any hyphenation patterns for
17             US english.^^J \space Think of getting some or the
18             latex2e setup will never succeed}\@@end}
19 \</default>
```

The following example describes the possible contents of a file `hyphen.cfg` that will load both US English and German hyphenation patterns, making the former the default. It sets `\language` to 0 for the US patterns and to 1 for the German patterns. Then `\language` is set to 0 to make this the default and the default values of `\lefthyphenmin` and `\righthyphenmin` are set.

```
\language=0
\input hyphen % (or \input ushyphen1 if the file has been renamed)
```

```
\language=1
\input ghyph31
\language=0
\lefthyphenmin=2
\righthyphenmin=3
\endinput
```

Another possibility is to use the package `babel`, by Johannes Braams. That package is distributed with a suitable `hyphen.cfg` file.

File P

ltxuatex.dtx

82 Overview

LuaTeX adds a number of engine-specific functions to TeX. Several of these require set up that is best done in the kernel or need related support functions. This file provides *basic* support for LuaTeX at the L^AT_EX 2_ε kernel level plus as a loadable file which can be used with plain TeX and L^AT_EX.

This file contains code for both TeX (to be stored as part of the format) and Lua (to be loaded at the start of each job). In the Lua code, the kernel uses the namespace `luatexbase`.

The following `\count` registers are used here for register allocation:

```
\e@alloc@attribute@count Attributes (default 258)
\e@alloc@ccodetable@count Category code tables (default 259)
\e@alloc@luafunction@count Lua functions (default 260)
  \e@alloc@whatsit@count User whatsits (default 261)
  \e@alloc@bytecode@count Lua bytecodes (default 262)
  \e@alloc@luachunk@count Lua chunks (default 263)
```

(`\count 256` is used for `\newmarks` allocation and `\count 257` is used for `\newXeTeXintercharclass` with XeTeX, with code defined in `ltxfinal.dtx`). With any L^AT_EX 2_ε kernel from 2015 onward these registers are part of the block in the extended area reserved by the kernel (prior to 2015 the L^AT_EX 2_ε kernel did not provide any functionality for the extended allocation area).

83 Core TeX functionality

The commands defined here are defined for possible inclusion in a future L^AT_EX format, however also extracted to the file `ltxuatex.tex` which may be used with older L^AT_EX formats, and with plain TeX.

<code>\newattribute</code>	<code>\newattribute{<attribute>}</code> Defines a named <code>\attribute</code> , indexed from 1 (<i>i.e.</i> <code>\attribute0</code> is never defined). Attributes initially have the marker value <code>-1</code> ('unset') set by the engine.
<code>\newcatcodetable</code>	<code>\newcatcodetable{<catcodetable>}</code> Defines a named <code>\catcodetable</code> , indexed from 1 (<code>\catcodetable0</code> is never assigned). A new catcode table will be populated with exactly those values assigned by IniTeX (as described in the LuaTeX manual).
<code>\newluafunction</code>	<code>\newluafunction{<function>}</code> Defines a named <code>\luafunction</code> , indexed from 1. (Lua indexes tables from 1 so <code>\luafunction0</code> is not available).
<code>\newwhatsit</code>	<code>\newwhatsit{<whatsit>}</code> Defines a custom <code>\whatsit</code> , indexed from 1.
<code>\newluabytecode</code>	<code>\newluabytecode{<bytecode>}</code>

	Allocates a number for Lua bytecode register, indexed from 1.
<code>\newluachunkname</code>	<code>newluachunkname{⟨chunkname⟩}</code> Allocates a number for Lua chunk register, indexed from 1. Also enters the name of the register (without backslash) into the <code>lua.name</code> table to be used in stack traces.
<code>\catcodetable@initex</code>	Predefined category code tables with the obvious assignments. Note that the
<code>\catcodetable@string</code>	<code>latex</code> and <code>atletter</code> tables set the full Unicode range to the codes predefined by
<code>\catcodetable@latex</code>	the kernel.
<code>\catcodetable@atletter</code>	<code>\setattribute{⟨attribute⟩}{⟨value⟩}</code>
<code>\setattribute</code>	<code>\unsetattribute{⟨attribute⟩}</code>
<code>\unsetattribute</code>	Set and unset attributes in a manner analogous to <code>\setlength</code> . Note that attributes take a marker value when unset so this operation is distinct from setting the value to zero.

84 Plain T_EX interface

The `luatex` interface may be used with plain T_EX using `\input{luatex}`. This inputs `luatex.tex` which inputs `etex.src` (or `etex.sty` if used with L^AT_EX) if it is not already input, and then defines some internal commands to allow the `luatex` interface to be defined.

The `luatexbase` package interface may also be used in plain T_EX, as before, by inputting the package `\input luatexbase.sty`. The new version of `luatexbase` is based on this `luatex` code but implements a compatibility layer providing the interface of the original package.

85 Lua functionality

85.1 Allocators in Lua

<code>new_attribute</code>	<code>luatexbase.new_attribute(⟨attribute⟩)</code> Returns an allocation number for the <code>⟨attribute⟩</code> , indexed from 1. The attribute will be initialised with the marker value <code>-0xFFFFFFFF</code> (‘unset’). The attribute allocation sequence is shared with the T _E X code but this function does <i>not</i> define a token using <code>\attributedef</code> . The attribute name is recorded in the <code>attributes</code> table. A metatable is provided so that the table syntax can be used consistently for attributes declared in T _E X or Lua.
<code>new_whatsit</code>	<code>luatexbase.new_whatsit(⟨whatsit⟩)</code> Returns an allocation number for the custom <code>⟨whatsit⟩</code> , indexed from 1.
<code>new_bytecode</code>	<code>luatexbase.new_bytecode(⟨bytecode⟩)</code> Returns an allocation number for a bytecode register, indexed from 1. The optional <code>⟨name⟩</code> argument is just used for logging.
<code>new_chunkname</code>	<code>luatexbase.new_chunkname(⟨chunkname⟩)</code> Returns an allocation number for a Lua chunk name for use with <code>\directlua</code> and <code>\latelua</code> , indexed from 1. The number is returned and also <code>⟨name⟩</code> argument is added to the <code>lua.name</code> array at that index.
<code>new_luafunction</code>	<code>luatexbase.new_luafunction(⟨functionname⟩)</code> Returns an allocation number for a lua function for use with <code>\luafunction</code> , <code>\lateluafunction</code> , and <code>\luaodef</code> , indexed from 1. The optional <code>⟨functionname⟩</code> argument is just used for logging.

These functions all require access to a named T_EX count register to manage their allocations. The standard names are those defined above for access from T_EX, *e.g.* “e@alloc@attribute@count, but these can be adjusted by defining the variable `<type>_count_name` before loading `ltluatex.lua`, for example

```
local attribute_count_name = "attributetracker"
require("ltluatex")
```

would use a T_EX `\count` (`\countdef`’d token) called `attributetracker` in place of “e@alloc@attribute@count.

85.2 Lua access to T_EX register numbers

`registernumber` `luatexbase.registernumber(<name>)`
Sometimes (notably in the case of Lua attributes) it is necessary to access a register *by number* that has been allocated by T_EX. This package provides a function to look up the relevant number using LuaT_EX’s internal tables. After for example `\newattribute\myattrib`, `\myattrib` would be defined by (say) `\myattrib=\attribute15`. `luatexbase.registernumber("myattrib")` would then return the register number, 15 in this case. If the string passed as argument does not correspond to a token defined by `\attributedef`, `\countdef` or similar commands, the Lua value `false` is returned.

As an example, consider the input:

```
\newcommand\test[1]{%
\typeout{#1: \expandafter\meaning\csname#1\endcsname^^J
\space\space\space\space
\directlua{tex.write(luatexbase.registernumber("#1") or "bad input")}}%
}

\test{undefinedrubbish}

\test{space}

\test{hbox}

\test{@MM}

\test{@tempdima}
\test{@tempdimb}

\test{strutbox}

\test{sixt@@n}

\attributedef\myattr=12
\myattr=200
\test{myattr}
```

If the demonstration code is processed with LuaL_AT_EX then the following would be produced in the log and terminal output.

```

undefinedrubbish: \relax
      bad input
space: macro:->
      bad input
hbox: \hbox
      bad input
@MM: \mathchar"4E20
      20000
@tempdima: \dimen14
      14
@tempdimb: \dimen15
      15
strutbox: \char"B
      11
sixt@@n: \char"10
      16
myattr: \attribute12
      12

```

Notice how undefined commands, or commands unrelated to registers do not produce an error, just return `false` and so print `bad input` here. Note also that commands defined by `\newbox` work and return the number of the box register even though the actual command holding this number is a `\chardef` defined token (there is no `\boxdef`).

85.3 Module utilities

`provides_module` `luatexbase.provides_module(<info>)`

This function is used by modules to identify themselves; the `info` should be a table containing information about the module. The required field `name` must contain the name of the module. It is recommended to provide a field `date` in the usual L^AT_EX format `yyyy/mm/dd`. Optional fields `version` (a string) and `description` may be used if present. This information will be recorded in the log. Other fields are ignored.

`module_info` `luatexbase.module_info(<module>, <text>)`
`module_warning` `luatexbase.module_warning(<module>, <text>)`
`module_error` `luatexbase.module_error(<module>, <text>)`

These functions are similar to L^AT_EX's `\PackageError`, `\PackageWarning` and `\PackageInfo` in the way they format the output. No automatic line breaking is done, you may still use `\n` as usual for that, and the name of the package will be prepended to each output line.

Note that `luatexbase.module_error` raises an actual Lua error with `error()`, which currently means a call stack will be dumped. While this may not look pretty, at least it provides useful information for tracking the error down.

85.4 Callback management

`add_to_callback` `luatexbase.add_to_callback(<callback>, <function>, <description>)` Registers the *<function>* into the *<callback>* with a textual *<description>* of the function. Functions are inserted into the callback in the order loaded.
`remove_from_callback` `luatexbase.remove_from_callback(<callback>, <description>)` Removes the call-

back function with $\langle description \rangle$ from the $\langle callback \rangle$. The removed function and its description are returned as the results of this function.

<code>in_callback</code>	<code>luatexbase.in_callback($\langle callback \rangle$, $\langle description \rangle$)</code> Checks if the $\langle description \rangle$ matches one of the functions added to the list for the $\langle callback \rangle$, returning a boolean value.
<code>disable_callback</code>	<code>luatexbase.disable_callback($\langle callback \rangle$)</code> Sets the $\langle callback \rangle$ to <code>false</code> as described in the LuaTeX manual for the underlying <code>callback.register</code> built-in. Callbacks will only be set to <code>false</code> (and thus be skipped entirely) if there are no functions registered using the callback.
<code>callback_descriptions</code>	A list of the descriptions of functions registered to the specified callback is returned. <code>{}</code> is returned if there are no functions registered.
<code>create_callback</code>	<code>luatexbase.create_callback($\langle name \rangle$,metatype,$\langle default \rangle$)</code> Defines a user defined callback. The last argument is a default function or <code>false</code> .
<code>call_callback</code>	<code>luatexbase.call_callback($\langle name \rangle$,...)</code> Calls a user defined callback with the supplied arguments.

86 Implementation

```
1  $\langle *2ekernel | tex | latexrelease \rangle$ 
2  $\langle 2ekernel | latexrelease \rangle \ifx \directlua \@undefined \else$ 
```

86.1 Minimum LuaTeX version

LuaTeX has changed a lot over time. In the kernel support for ancient versions is not provided: trying to build a format with a very old binary therefore gives some information in the log and loading stops. The cut-off selected here relates to the tree-searching behaviour of `require()`: from version 0.60, LuaTeX will correctly find Lua files in the `texmf` tree without ‘help’.

```
3  $\langle latexrelease \rangle \backslash IncludeInRelease \{2015/10/01\}$ 
4  $\langle latexrelease \rangle \backslash newluafunction \{LuaTeX\} \%$ 
5  $\backslash ifnum \luatexversion < 60 \%$ 
6  $\backslash wlog \{*****\}$ 
7  $\backslash wlog \{* LuaTeX version too old for l\luatex support *\}$ 
8  $\backslash wlog \{*****\}$ 
9  $\backslash expandafter \backslash endinput$ 
10  $\backslash fi$ 
```

86.2 Older L^AT_EX/Plain T_EX setup

```
11  $\langle *tex \rangle$ 
```

Older L^AT_EX formats don’t have the primitives with ‘native’ names: sort that out. If they already exist this will still be safe.

```
12  $\backslash directlua \{tex.enableprimitives("",tex.extraprimitives("luatex"))\}$ 
13  $\backslash ifx \e@alloc \@undefined$ 
14  $\backslash ifx \documentclass \@undefined$ 
15  $\backslash ifx \loccount \@undefined$ 
16  $\backslash input \{etex.src\} \%$ 
17  $\backslash fi$ 
18  $\backslash catcode '\@=11 \%$ 
```

In pre-2014 L^AT_EX, or plain T_EX, load `etex.{sty,src}`.

```

19 \outer\expandafter\def\csname newfam\endcsname
20 \csname \alloc@8\fam\chardef\et@xmaxfam}
21 \else
22 \RequirePackage{etex}
23 \expandafter\def\csname newfam\endcsname
24 \csname \alloc@8\fam\chardef\et@xmaxfam}
25 \expandafter\let\expandafter\new@mathgroup\csname newfam\endcsname
26 \fi

```

86.2.1 Fixes to etex.src/etex.sty

These could and probably should be made directly in an update to `etex.src` which already has some Lua_T_EX-specific code, but does not define the correct range for Lua_T_EX.

2015-07-13 higher range in luatex.

```
27 \edef \et@xmaxregs {\ifx\directlua\undefined 32768\else 65536\fi}
```

luatex/xetex also allow more math fam.

```

28 \edef \et@xmaxfam {\ifx\Umathchar\undefined\sixt@@n\else\ccclvi\fi}

29 \count 270=\et@xmaxregs % locally allocates \count registers
30 \count 271=\et@xmaxregs % ditto for \dimen registers
31 \count 272=\et@xmaxregs % ditto for \skip registers
32 \count 273=\et@xmaxregs % ditto for \muskip registers
33 \count 274=\et@xmaxregs % ditto for \box registers
34 \count 275=\et@xmaxregs % ditto for \toks registers
35 \count 276=\et@xmaxregs % ditto for \marks classes

```

and 256 or 16 fam. (Done above due to plain/L^AT_EX differences in l_tuatex.)

```
36 % \outer\def\newfam{\alloc@8\fam\chardef\et@xmaxfam}
```

End of proposed changes to `etex.src`

86.2.2 luatex specific settings

Switch to global cf `luatex.sty` to leave room for inserts not really needed for luatex but possibly most compatible with existing use.

```

37 \expandafter\let\csname newcount\expandafter\expandafter\endcsname
38 \csname globcount\endcsname
39 \expandafter\let\csname newdimen\expandafter\expandafter\endcsname
40 \csname globdimen\endcsname
41 \expandafter\let\csname newskip\expandafter\expandafter\endcsname
42 \csname globskip\endcsname
43 \expandafter\let\csname newbox\expandafter\expandafter\endcsname
44 \csname globbox\endcsname

```

Define `\e@alloc` as in latex (the existing macros in `etex.src` hard to extend to further register types as they assume specific 26x and 27x count range. For compatibility the existing register allocation is not changed.

```

45 \chardef\e@alloc@top=65535
46 \let\e@alloc\chardef\chardef

47 \def\e@alloc#1#2#3#4#5#6{%
48 \global\advance#3\@ne
49 \e@ch@ck{#3}{#4}{#5}#1%
50 \allocationnumber#3\relax
51 \global#2#6\allocationnumber

```

```

52 \wlog{\string#6=\string#1\the\allocationnumber}}%
53 \gdef\e@ch@ck#1#2#3#4{%
54 \ifnum#1<#2\else
55 \ifnum#1=#2\relax
56 #1\@cclvi
57 \ifx\count#4\advance#1 10 \fi
58 \fi
59 \ifnum#1<#3\relax
60 \else
61 \errmessage{No room for a new \string#4}%
62 \fi
63 \fi}%

```

Two simple L^AT_EX macros used in `lAtex.sty`.

```

64 \long\def\@gobble#1{}
65 \long\def\@firstofone#1{#1}

```

Fix up allocations not to clash with `etex.src`.

```

66 \expandafter\csname newcount\endcsname\@alloc@attribute@count
67 \expandafter\csname newcount\endcsname\@alloc@ccodetable@count
68 \expandafter\csname newcount\endcsname\@alloc@luafunction@count
69 \expandafter\csname newcount\endcsname\@alloc@whatsit@count
70 \expandafter\csname newcount\endcsname\@alloc@bytecode@count
71 \expandafter\csname newcount\endcsname\@alloc@luachunk@count

```

End of conditional setup for plain T_EX / old L^AT_EX.

```

72 \fi
73 \</tex>

```

86.3 Attributes

`\newattribute` As is generally the case for the LuaT_EX registers we start here from 1. Notably, some code assumes that `\attribute0` is never used so this is important in this case.

```

74 \ifx\@alloc@attribute@count\@undefined
75 \countdef\@alloc@attribute@count=258
76 \fi
77 \def\newattribute#1{%
78 \e@alloc@attribute\attributedef
79 \e@alloc@attribute@count\m@ne\@alloc@top#1%
80 }
81 \e@alloc@attribute@count=\z@

```

`\setattribute` Handy utilities.

```

\unsetattribute 82 \def\setattribute#1#2{#1=\numexpr#2\relax}
83 \def\unsetattribute#1{#1=-"7FFFFFFF\relax}

```

86.4 Category code tables

`\newcatcodetable` Category code tables are allocated with a limit half of that used by LuaT_EX for everything else. At the end of allocation there needs to be an initialisation step. Table 0 is already taken (it's the global one for current use) so the allocation starts at 1.

```

84 \ifx\e@alloc@ccodetable@count\@undefined
85 \countdef\e@alloc@ccodetable@count=259
86 \fi
87 \def\newcatcodetable#1{%
88   \e@alloc\catcodetable\chardef
89   \e@alloc@ccodetable@count\m@ne{"8000}#1%
90   \initcatcodetable\allocationnumber
91 }
92 \e@alloc@ccodetable@count=\z@

```

`\catcodetable@initex` Save a small set of standard tables. The Unicode data is read here in using a parser
`\catcodetable@string` simplified from that in load-unicode-data: only the nature of letters needs to
`\catcodetable@latex` be detected.
`\catcodetable@atletter`

```

93 \newcatcodetable\catcodetable@initex
94 \newcatcodetable\catcodetable@string
95 \begingroup
96   \def\setrangecatcode#1#2#3{%
97     \ifnum#1>#2 %
98       \expandafter\@gobble
99     \else
100       \expandafter\@firstofone

171 }
172 \endgroup

```

86.5 Named Lua functions

`\newluafunction` Much the same story for allocating Lua_{TEX} functions except here they are just numbers so they are allocated in the same way as boxes. Lua indexes from 1 so once again slot 0 is skipped.

```

173 \ifx\e@alloc@luafunction@count\undefined
174   \countdef\e@alloc@luafunction@count=260
175 \fi
176 \def\newluafunction{%
177   \e@alloc@luafunction\e@alloc@chardef
178   \e@alloc@luafunction@count\m@ne\e@alloc@top
179 }

```

```
180 \e@alloc@luafunction@count=\z@
```

86.6 Custom whatsits

`\newwhatsit` These are only settable from Lua but for consistency are definable here.

```
181 \ifx\e@alloc@whatsit@count\@undefined
182 \countdef\e@alloc@whatsit@count=261
183 \fi
184 \def\newwhatsit#1{%
185   \e@alloc\whatsit\e@alloc@chardef
186   \e@alloc@whatsit@count\m@ne\e@alloc@top#1%
187 }
188 \e@alloc@whatsit@count=\z@
```

86.7 Lua bytecode registers

`\newluabytocode` These are only settable from Lua but for consistency are definable here.

```
189 \ifx\e@alloc@bytocode@count\@undefined
190 \countdef\e@alloc@bytocode@count=262
191 \fi
192 \def\newluabytocode#1{%
193   \e@alloc\luabytocode\e@alloc@chardef
194   \e@alloc@bytocode@count\m@ne\e@alloc@top#1%
195 }
196 \e@alloc@bytocode@count=\z@
```

86.8 Lua chunk registers

`\newluachunkname` As for bytecode registers, but in addition we need to add a string to the `lua.name` table to use in stack tracing. We use the name of the command passed to the allocator, with no backslash.

```
197 \ifx\e@alloc@luachunk@count\@undefined
198 \countdef\e@alloc@luachunk@count=263
199 \fi
200 \def\newluachunkname#1{%
201   \e@alloc\luachunk\e@alloc@chardef
202   \e@alloc@luachunk@count\m@ne\e@alloc@top#1%
203   {\escapechar\m@ne
204    \directlua{lua.name[\the\allocationnumber]="\string#1"}}%
205 }
206 \e@alloc@luachunk@count=\z@
```

86.9 Lua loader

Load the Lua code at the start of every job. For the conversion of \TeX into numbers at the Lua side we need some known registers: for convenience we use a set of systematic names, which means using a group around the Lua loader.

```
207 <2ekernel>\everyjob\expandafter{%
208 <2ekernel> \the\everyjob
209 \begingroup
210 \attributedef\attributezero=0 %
211 \chardef \charzero =0 %
```

Note name change required on older luatex, for hash table access.

```

212 \countdef \CountZero =0 %
213 \dimendef \dimenzero =0 %
214 \mathchardef \mathcharzero =0 %
215 \muskipdef \muskipzero =0 %
216 \skipdef \skipzero =0 %
217 \toksdef \tokszero =0 %

86.10 Lua module preliminaries

```
274 <*lua>
```

Some set up for the Lua module which is needed for all of the Lua functionality added here.

luatexbase Set up the table for the returned functions. This is used to expose all of the public functions.

```

275 luatexbase      = luatexbase or { }
276 local luatexbase = luatexbase

```

Some Lua best practice: use local versions of functions where possible.

```

277 local string_gsub      = string.gsub
278 local tex_count        = tex.count
279 local tex_setattribute  = tex.setattribute
280 local tex_setcount     = tex.setcount
281 local texio_write_nl   = texio.write_nl

282 local luatexbase_warning
283 local luatexbase_error

```

86.11 Lua module utilities

86.11.1 Module tracking

modules To allow tracking of module usage, a structure is provided to store information and to return it.

```
284 local modules = modules or { }
```

provides_module Local function to write to the log.

```

285 local function luatexbase_log(text)
286   texio_write_nl("log", text)
287 end

```

Modelled on `\ProvidesPackage`, we store much the same information but with a little more structure.

```

288 local function provides_module(info)
289   if not (info and info.name) then
290     luatexbase_error("Missing module name for provides_module")
291   end
292   local function spaced(text)
293     return text and (" " .. text) or ""

```

```

294 end
295 luatexbase_log(
296   "Lua module: " .. info.name
297   .. spaced(info.date)
298   .. spaced(info.version)
299   .. spaced(info.description)
300 )
301 modules[info.name] = info
302 end
303 luatexbase.provides_module = provides_module

```

86.11.2 Module messages

There are various warnings and errors that need to be given. For warnings we can get exactly the same formatting as from \TeX . For errors we have to make some changes. Here we give the text of the error in the \LaTeX format then force an error from Lua to halt the run. Splitting the message text is done using `\n` which takes the place of `\MessageBreak`.

First an auxiliary for the formatting: this measures up the message leader so we always get the correct indent.

```

304 local function msg_format(mod, msg_type, text)
305   local leader = ""
306   local cont
307   local first_head
308   if mod == "LaTeX" then
309     cont = string_gsub(leader, ".", " ")
310     first_head = leader .. "LaTeX: "
311   else
312     first_head = leader .. "Module " .. msg_type
313     cont = "(" .. mod .. ")"
314     .. string_gsub(first_head, ".", " ")
315     first_head = leader .. "Module " .. mod .. " " .. msg_type .. ":"
316   end
317   if msg_type == "Error" then
318     first_head = "\n" .. first_head
319   end
320   if string.sub(text,-1) ~= "\n" then
321     text = text .. " "
322   end
323   return first_head .. " "
324   .. string_gsub(
325     text
326     .. "on input line "
327     .. tex.inputlineno, "\n", "\n" .. cont .. " "
328   )
329   .. "\n"
330 end

```

```

module_info Write messages.
module_warning 331 local function module_info(mod, text)
module_error 332   texio_write_nl("log", msg_format(mod, "Info", text))
333 end
334 luatexbase.module_info = module_info

```

```

335 local function module_warning(mod, text)
336   texio_write_nl("term and log",msg_format(mod, "Warning", text))
337 end
338 luatexbase.module_warning = module_warning
339 local function module_error(mod, text)
340   error(msg_format(mod, "Error", text))
341 end
342 luatexbase.module_error = module_error

```

Dedicated versions for the rest of the code here.

```

343 function luatexbase_warning(text)
344   module_warning("luatexbase", text)
345 end
346 function luatexbase_error(text)
347   module_error("luatexbase", text)
348 end

```

86.12 Accessing register numbers from Lua

Collect up the data from the T_EX level into a Lua table: from version 0.80, LuaT_EX makes that easy.

```

349 local luaregisterbasetable = { }
350 local registermap = {
351   attributezero = "assign_attr"   ,
352   charzero      = "char_given"    ,
353   CountZero     = "assign_int"     ,
354   dimenzero     = "assign_dimen"   ,
355   mathcharzero  = "math_given"     ,
356   muskipzero    = "assign_mu_skip" ,
357   skipzero      = "assign_skip"    ,
358   tokszero      = "assign_toks"    ,
359 }
360 local createtoken
361 if tex.luatexversion > 81 then
362   createtoken = token.create
363 elseif tex.luatexversion > 79 then
364   createtoken = newtoken.create
365 end
366 local hashtokens = tex.hashtokens()
367 local luatexversion = tex.luatexversion
368 for i,j in pairs (registermap) do
369   if luatexversion < 80 then
370     luaregisterbasetable[hashtokens[i][1]] =
371       hashtokens[i][2]
372   else
373     luaregisterbasetable[j] = createtoken(i).mode
374   end
375 end

```

registernumber Working out the correct return value can be done in two ways. For older LuaT_EX releases it has to be extracted from the `hashtokens`. On the other hand, newer LuaT_EX's have `newtoken`, and whilst `.mode` isn't currently documented, Hans Hagen pointed to this approach so we should be OK.

```

376 local registernumber
377 if luatexversion < 80 then
378   function registernumber(name)
379     local nt = hashtokens[name]
380     if(nt and luaregisterbasetable[nt[1]]) then
381       return nt[2] - luaregisterbasetable[nt[1]]
382     else
383       return false
384     end
385   end
386 else
387   function registernumber(name)
388     local nt = createtoken(name)
389     if(luaregisterbasetable[nt.cmdname]) then
390       return nt.mode - luaregisterbasetable[nt.cmdname]
391     else
392       return false
393     end
394   end
395 end
396 luatexbase.registernumber = registernumber

```

86.13 Attribute allocation

new_attribute As attributes are used for Lua manipulations its useful to be able to assign from this end.

```

397 local attributes=setmetatable(
398 {},
399 {
400   __index = function(t,key)
401     return registernumber(key) or nil
402   end}
403 )
404 luatexbase.attributes = attributes
405 local attribute_count_name =
406   attribute_count_name or "e@alloc@attribute@count"
407 local function new_attribute(name)
408   tex_setcount("global", attribute_count_name,
409     tex_count[attribute_count_name] + 1)
410   if tex_count[attribute_count_name] > 65534 then
411     luatexbase_error("No room for a new \\attribute")
412   end
413   attributes[name]= tex_count[attribute_count_name]
414   luatexbase_log("Lua-only attribute " .. name .. " = " ..
415     tex_count[attribute_count_name])
416   return tex_count[attribute_count_name]
417 end
418 luatexbase.new_attribute = new_attribute

```

86.14 Custom whatsit allocation

new_whatsit Much the same as for attribute allocation in Lua.

```

419 local whatsit_count_name = whatsit_count_name or "e@alloc@whatsit@count"

```

```

420 local function new_whatsit(name)
421   tex_setcount("global", whatsit_count_name,
422               tex_count[whatsit_count_name] + 1)
423   if tex_count[whatsit_count_name] > 65534 then
424     luatexbase_error("No room for a new custom whatsit")
425   end
426   luatexbase_log("Custom whatsit " .. (name or "") .. " = " ..
427                 tex_count[whatsit_count_name])
428   return tex_count[whatsit_count_name]
429 end
430 luatexbase.new_whatsit = new_whatsit

```

86.15 Bytecode register allocation

new_bytecode Much the same as for attribute allocation in Lua. The optional *<name>* argument is used in the log if given.

```

431 local bytecode_count_name =
432     bytecode_count_name or "e@alloc@bytecode@count"
433 local function new_bytecode(name)
434   tex_setcount("global", bytecode_count_name,
435               tex_count[bytecode_count_name] + 1)
436   if tex_count[bytecode_count_name] > 65534 then
437     luatexbase_error("No room for a new bytecode register")
438   end
439   luatexbase_log("Lua bytecode " .. (name or "") .. " = " ..
440                 tex_count[bytecode_count_name])
441   return tex_count[bytecode_count_name]
442 end
443 luatexbase.new_bytecode = new_bytecode

```

86.16 Lua chunk name allocation

new_chunkname As for bytecode registers but also store the name in the `lua.name` table.

```

444 local chunkname_count_name =
445     chunkname_count_name or "e@alloc@luachunk@count"
446 local function new_chunkname(name)
447   tex_setcount("global", chunkname_count_name,
448               tex_count[chunkname_count_name] + 1)
449   local chunkname_count = tex_count[chunkname_count_name]
450   chunkname_count = chunkname_count + 1
451   if chunkname_count > 65534 then
452     luatexbase_error("No room for a new chunkname")
453   end
454   lua.name[chunkname_count]=name
455   luatexbase_log("Lua chunkname " .. (name or "") .. " = " ..
456                 chunkname_count .. "\n")
457   return chunkname_count
458 end
459 luatexbase.new_chunkname = new_chunkname

```

86.17 Lua function allocation

`new_luafunction` Much the same as for attribute allocation in Lua. The optional $\langle name \rangle$ argument is used in the log if given.

```
460 local luafunction_count_name =
461     luafunction_count_name or "e@alloc@luafunction@count"
462 local function new_luafunction(name)
463     tex_setcount("global", luafunction_count_name,
464         tex_count[luafunction_count_name] + 1)
465     if tex_count[luafunction_count_name] > 65534 then
466         luatexbase_error("No room for a new luafunction register")
467     end
468     luatexbase_log("Lua function " .. (name or "") .. " = " ..
469         tex_count[luafunction_count_name])
470     return tex_count[luafunction_count_name]
471 end
472 luatexbase.new_luafunction = new_luafunction
```

86.18 Lua callback management

The native mechanism for callbacks in LuaTeX allows only one per function. That is extremely restrictive and so a mechanism is needed to add and remove callbacks from the appropriate hooks.

86.18.1 Housekeeping

The main table: keys are callback names, and values are the associated lists of functions. More precisely, the entries in the list are tables holding the actual function as `func` and the identifying description as `description`. Only callbacks with a non-empty list of functions have an entry in this list.

```
473 local callbacklist = callbacklist or { }
```

Numerical codes for callback types, and name-to-value association (the table keys are strings, the values are numbers).

```
474 local list, data, exclusive, simple, reverselist = 1, 2, 3, 4, 5
475 local types = {
476     list      = list,
477     data      = data,
478     exclusive = exclusive,
479     simple    = simple,
480     reverselist = reverselist,
481 }
```

Now, list all predefined callbacks with their current type, based on the LuaTeX manual version 1.01. A full list of the currently-available callbacks can be obtained using

```
\directlua{
  for i,_ in pairs(callback.list()) do
    texio.write_nl("- " .. i)
  end
}
```

```
\bye
```

in plain LuaTeX. (Some undocumented callbacks are omitted as they are to be removed.)

482 local callbacktypes = callbacktypes or {

Section 8.2: file discovery callbacks.

```
483 find_read_file      = exclusive,
484 find_write_file     = exclusive,
485 find_font_file      = data,
486 find_output_file    = data,
487 find_format_file    = data,
488 find_vf_file        = data,
489 find_map_file       = data,
490 find_enc_file       = data,
491 find_pk_file        = data,
492 find_data_file      = data,
493 find_opentype_file  = data,
494 find_truetype_file  = data,
495 find_type1_file     = data,
496 find_image_file     = data,
```

```
497 open_read_file      = exclusive,
498 read_font_file      = exclusive,
499 read_vf_file        = exclusive,
500 read_map_file       = exclusive,
501 read_enc_file       = exclusive,
502 read_pk_file        = exclusive,
503 read_data_file      = exclusive,
504 read_truetype_file  = exclusive,
505 read_type1_file     = exclusive,
506 read_opentype_file  = exclusive,
```

Not currently used by luatex but included for completeness. may be used by a font handler.

```
507 find_cidmap_file   = data,
508 read_cidmap_file    = exclusive,
```

Section 8.3: data processing callbacks.

558 }

```

```

559 luatexbase.callbacktypes=callbacktypes

```

callback.register Save the original function for registering callbacks and prevent the original being used. The original is saved in a place that remains available so other more sophisticated code can override the approach taken by the kernel if desired.

```

560 local callback_register = callback_register or callback.register
561 function callback.register()
562   luatexbase_error("Attempt to use callback.register() directly\n")
563 end

```

86.18.2 Handlers

The handler function is registered into the callback when the first function is added to this callback's list. Then, when the callback is called, the handler takes care

of running all functions in the list. When the last function is removed from the callback's list, the handler is unregistered.

More precisely, the functions below are used to generate a specialized function (closure) for a given callback, which is the actual handler.

The way the functions are combined together depends on the type of the callback. There are currently 4 types of callback, depending on the calling convention of the functions the callback can hold:

simple is for functions that don't return anything: they are called in order, all with the same argument;

data is for functions receiving a piece of data of any type except node list head (and possibly other arguments) and returning it (possibly modified): the functions are called in order, and each is passed the return value of the previous (and the other arguments untouched, if any). The return value is that of the last function;

list is a specialized variant of *data* for functions filtering node lists. Such functions may return either the head of a modified node list, or the boolean values **true** or **false**. The functions are chained the same way as for *data* except that for the following. If one function returns **false**, then **false** is immediately returned and the following functions are *not* called. If one function returns **true**, then the same head is passed to the next function. If all functions return **true**, then **true** is returned, otherwise the return value of the last function not returning **true** is used.

reverselist is a specialized variant of *list* which executes functions in inverse order.

exclusive is for functions with more complex signatures; functions in this type of callback are *not* combined: An error is raised if a second callback is registered..

Handler for **data** callbacks.

```
564 local function data_handler(name)
565   return function(data, ...)
566     for _,i in ipairs(callbacklist[name]) do
567       data = i.func(data,...)
568     end
569     return data
570   end
571 end
```

Default for user-defined **data** callbacks without explicit default.

```
572 local function data_handler_default(value)
573   return value
574 end
```

Handler for **exclusive** callbacks. We can assume `callbacklist[name]` is not empty: otherwise, the function wouldn't be registered in the callback any more.

```
575 local function exclusive_handler(name)
576   return function(...)
577     return callbacklist[name][1].func(...)
578   end
579 end
```

Handler for list callbacks.

```
580 local function list_handler(name)
581   return function(head, ...)
582     local ret
583     local alltrue = true
584     for _,i in ipairs(callbacklist[name]) do
585       ret = i.func(head, ...)
586       if ret == false then
587         luatexbase_warning(
588           "Function '" .. i.description .. "' returned false\n"
589           .. "in callback '" .. name .. "'")
590       )
591       break
592     end
593     if ret ~= true then
594       alltrue = false
595       head = ret
596     end
597   end
598   return alltrue and true or head
599 end
600 end
```

Default for user-defined list and reverselist callbacks without explicit default.

```
601 local function list_handler_default()
602   return true
603 end
```

Handler for reverselist callbacks.

```
604 local function reverselist_handler(name)
605   return function(head, ...)
606     local ret
607     local alltrue = true
608     local callbacks = callbacklist[name]
609     for i = #callbacks, 1, -1 do
610       local cb = callbacks[i]
611       ret = cb.func(head, ...)
612       if ret == false then
613         luatexbase_warning(
614           "Function '" .. cb.description .. "' returned false\n"
615           .. "in callback '" .. name .. "'")
616       )
617       break
618     end
619     if ret ~= true then
620       alltrue = false
621       head = ret
622     end
623   end
624   return alltrue and true or head
625 end
626 end
```

Handler for simple callbacks.

```
627 local function simple_handler(name)
```

```

628 return function(...)
629   for _,i in ipairs(callbacklist[name]) do
630     i.func(...)
631   end
632 end
633 end

```

Default for user-defined `simple` callbacks without explicit default.

```

634 local function simple_handler_default()
635 end

```

Keep a handlers table for indexed access and a table with the corresponding default functions.

```

636 local handlers = {
637   [data]      = data_handler,
638   [exclusive] = exclusive_handler,
639   [list]      = list_handler,
640   [reverselist] = reverselist_handler,
641   [simple]     = simple_handler,
642 }
643 local defaults = {
644   [data]      = data_handler_default,
645   [exclusive] = nil,
646   [list]      = list_handler_default,
647   [reverselist] = list_handler_default,
648   [simple]     = simple_handler_default,
649 }

```

86.18.3 Public functions for callback management

Defining user callbacks perhaps should be in package code, but impacts on `add_to_callback`. If a default function is not required, it may be declared as `false`. First we need a list of user callbacks.

```

650 local user_callbacks_defaults = {
651   pre_mlist_to_hlist_filter = list_handler_default,
652   mlist_to_hlist = node.mlist_to_hlist,
653   post_mlist_to_hlist_filter = list_handler_default,
654 }

```

`create_callback` The allocator itself.

```

655 local function create_callback(name, ctype, default)
656   local ctype_id = types[ctype]
657   if not name or name == ""
658   or not ctype_id
659   then
660     luatexbase_error("Unable to create callback:\n" ..
661                       "valid callback name and type required")
662   end
663   if callbacktypes[name] then

819     end
820   end
821   return d
822 end
823 luatexbase.callback_descriptions = callback_descriptions
```

uninstall Unlike at the T_EX level, we have to provide a back-out mechanism here at the same time as the rest of the code. This is not meant for use by anything other than `latexrelease`: as such this is *deliberately* not documented for users!

```
824 local function uninstall()
825   module_info(
826     "luatexbase",
827     "Uninstalling kernel luatexbase code"
828   )
829   callback.register = callback_register
830   luatexbase = nil
831 end
832 luatexbase.uninstall = uninstall
```

mlist_to_hlist To emulate these callbacks, the “real” `mlist_to_hlist` is replaced by a wrapper calling the wrappers before and after.

```
833 callback_register("mlist_to_hlist", function(head, display_type, need_penalties)
834   local current = call_callback("pre_mlist_to_hlist_filter", head, display_type, need_penalties)
835   if current == false then
836     flush_list(head)
837     return nil
838   elseif current == true then
839     current = head
840   end
841   current = call_callback("mlist_to_hlist", current, display_type, need_penalties)
842   local post = call_callback("post_mlist_to_hlist_filter", current, display_type, need_penalties)
843   if post == true then
844     return current
845   elseif post == false then
846     flush_list(current)
847     return nil
848   end
849   return post
850 end)
851  $\langle$ /lua $\rangle$ 
```

Reset the catcode of @.

```
852 (tex)\catcode'\@=\etatcatcode\relax
```

The default values of the picture and \fbox parameters:

```

82 \unitlength = 1pt
83 \fboxsep = 3pt
84 \fboxrule = .4pt

```

The saved value of T_EX's \maxdepth:

```

85 \@maxdepth = \maxdepth

```

\vsize initialized because a \clearpage with \vsize < \topskip causes trouble.
 \@colroom and \@colht also initialized because \vsize may be set to them if a
 \clearpage is done before the \begin{document}

```

86 \vsize = 1000pt
87 \@colroom = \vsize
88 \@colht = \vsize

```

Initialise \textheight \textwidth and page style, to avoid internal errors if they
 are not set by the class.

```

89 \textheight=.5\maxdimen
90 \textwidth=\textheight
91 \ps@empty

```

87.3 Lccodes for hyphenation

For 7- and 8-bit engines the assumption of T1 encodings is the basis for the hyphenation patterns. That's not the case for the Unicode engines, where the assumption is engine-native working. The common loader system provides access to data from the Unicode Consortium covering not only \lccode but also other related data. The \lccode part of that at least needs to be loaded before hyphenation is tackled: XeT_EX follows the standard T_EX route of building patterns into the format. LuaT_EX doesn't require this data be loaded *here* but it does need to be loaded somewhere. Rather than test for the Unicode engines by name, the approach here is to look for the extended math mode handling both provide: any other engine developed in this area will presumably also provide \Umathcode.

```

```

There is one over-ride that makes sense here (see below for the same for 8-bit engines): setting the lccode for - to itself.

```
157 \lccode'\- ='\- % default hyphen char
```

The alternative is that a “traditional” engine is in use.

```
158 \else
```

We set things up so that hyphenation files can assume that the default (T1) lccodes are in use (at present this also sets up the uccodes). We temporarily define `\reserved@a` to apply `\reserved@c` to all the numbers in the range of its arguments.

```

159 \def\reserved@a#1#2{%
160   \@tempcnta#1\relax
161   \@tempcntb#2\relax
162   \reserved@b
163 }
164 \def\reserved@b{%
165   \ifnum\@tempcnta>\@tempcntb\else
166     \reserved@c\@tempcnta
167     \advance\@tempcnta\@ne
168     \expandafter\reserved@b
169   \fi
170 }

```

Depending on the T_EX version, we might not be allowed to do this for non-ASCII characters.

```

171 \def\reserved@c#1{%
172   \count@=#1\advance\count@ by -"20
173   \uccode#1=\count@
174   \lccode#1=#1
175 }
176 \reserved@a{'\a}{'\z}
177 \reserved@a{"A0}{\BC}
178 \reserved@a{"E0}{\FF}

```

The upper case characters need their `\uccode` and `\lccode` values set, and their `\sfcode` set to 999.

```

179 \def\reserved@c#1{%
180   \count@=#1\advance\count@ by "20
181   \uccode#1=#1
182   \lccode#1=\count@
183   \sfcode#1=999
184 }
185 \reserved@a{'\A}{'\Z}
186 \reserved@a{"80}{\9C}
187 \reserved@a{"C0}{\DF}

```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose uccode or lccode isn't quite what you'd expect.

```

188 \uccode'\^^Y='^I      % dotless i
189 \lccode'\^^Y='^Y      % dotless i
190 \uccode'\^^Z='^J      % dotless j, ae in OT1
191 \lccode'\^^Z='^Z      % dotless j, ae in OT1
192 \lccode'\^^9d='^i     % dotted I
193 \uccode'\^^9d='^9d    % dotted I
194 \lccode'\^^9e='^9e    % d-bar
195 \uccode'\^^9e='^d0    % d-bar

```

Finally here is one that helps hyphenation in the OT1 encoding.

```

196 \lccode'\^^[='^^[    % oe in OT1

```

And we also set the `\lccode` of `\-` and `\textcompwordmark` so that they do not prevent hyphenation in the remainder of the word (as suggested by Lars Helström).

```
197 \lccode'\- ='\- % default hyphen char
198 \lccode 127=127 % alternate hyphen char
199 \lccode 23 =23 % textcompwordmark in T1
```

End of the conditional to select either Unicode or T1 encoding defaults.

```
200 \fi
```

This is as good a place as any to active a few XeTeX-specific settings

```
201 \ifx\XeTeXuseglyphmetrics\@undefined
202 \else
203   \XeTeXuseglyphmetrics=1 %
204   \XeTeXdashbreakstate=1 %
205 \fi
```

87.4 Hyphenation

The following code will be compiled into the format file. It checks for the existence of `hyphen.cfg` in inputs that file if found. Otherwise it inputs `hyphen.ltx`. Note that these are loaded in *before* the `\catcodes` are set, so local hyphenation files can use 8-bit input.

We try to load the customized hyphenation description file.

```
206 \InputIfFileExists{hyphen.cfg}
207   {\typeout{=====^J%
208             Local configuration file hyphen.cfg used^J%
209             =====}%
210   \def\@addtofilelist##1{\xdef\@filelist{\@filelist,##1}}%
211   }
212   {\input{hyphen.ltx}}
213 \let\@addtofilelist\@gobble
```

`\l@nohyphenation`

```
214 \ifx\l@nohyphenation \@undefined
215   \newlanguage\l@nohyphenation
216 \fi
```

`\document@default@language` Default document language. -1 acts as language 0, but used as a flag in `\document` to see if it has been set in the preamble.

```
217 \</2ekernel>
218 \<*2ekernel | latexrelease>
219 \<latexrelease>\IncludeInRelease{2017/04/15}%
220 \<latexrelease>          {\document@default@language}{Save language for hyphenation}%
221 \let\document@default@language\m@ne
222 \</2ekernel | latexrelease>
223 \<latexrelease>\EndIncludeInRelease
224 \<latexrelease>\IncludeInRelease{0000/00/00}%
225 \<latexrelease>          {\document@default@language}{Save language for hyphenation}%
226 \<latexrelease>\let\document@default@language\@undefined
227 \<latexrelease>\EndIncludeInRelease
228 \<*2ekernel>
```

87.5 Font loading

Fonts loaded during the formatting process might already have changed the `\font@submax` from 0pt to something higher. If so, we put out a bold warning.

```
229 \ifdim \font@submax >\z@
230   \@font@warning{Size substitutions with differences\MessageBreak
231                 up to \font@submax\space have occurred.\MessageBreak
232                 \MessageBreak
233                 Please check the transcript file
234                 carefully\MessageBreak
235                 and redo the format generation if necessary!
236                 \@gobbletwo}%
237 \errhelp{Only stopped, to give you time to
238         read the above message.}
239 \errmessage{}
```

We reset the macro. Otherwise every user will get a warning on every job.

```
240 \def\font@submax{0pt}
241 \fi
```

87.6 Input encoding

Starting with the 2018 L^AT_EX release default the inputencoding to UTF-8. Unless the format is being used with luatex, xetex, enc_{te}x or ml_{te}x.

This is done in a way largely compatible with older releases: `utf8.def` is input just as if

```
\usepackage[utf8]{inputenc}
```

had been used, however rather than input the whole package a minimal core part just enough to support loading the UTF-8 encoding files is defined here.

If a document re-specifies UTF-8 this is silently ignored.

```
242 (/2ekernel)
243 (*2ekernel | latexrelease)
```

Check that a classic 8-bit tex engine is being used (LaTeX or PDFLaTeX).

```
244 (latexrelease)\IncludeInRelease{2018/04/01}%
245 (latexrelease)          {\UTFviii@invalid}{UTF-8 default}%
```

Skip this section in Unicode TeX, or if MLTeX and EncTeX are enabled.

```

```

Set the special catcodes (although some of these are useless, since an error will have occurred if the catcodes have changed). Note that ^^J has catcode ‘other’

for use in warning messages.

```

402 \catcode'\ =10
403 \catcode'\#=6
404 \catcode'\$=3
405 \catcode'\%=14
406 \catcode'\&=4
407 \catcode'\\=0
408 \catcode'\^=7
409 \catcode'\_ =8
410 \catcode'\{=1
411 \catcode'\}=2
412 \catcode'\~=13
413 \catcode'\@=11
414 \catcode'\^^I=10
415 \catcode'\^^J=12
416 \catcode'\^^L=13
417 \catcode'\^^M=5

```

Set the ‘other’ catcodes.

```

418 \def\reserved@c#1{\catcode#1=12\relax}
419 \reserved@c{'\!}
420 \reserved@c{'\"}
421 \reserved@a{'\' }{'\?}
422 \reserved@c{'\[]
423 \reserved@c{'\]}
424 \reserved@c{'\' }
425 \reserved@c{'\|}

```

Set the ‘letter’ catcodes.

```

426 \def\reserved@c#1{\catcode#1=11\relax}
427 \reserved@a{'\A}{'\Z}
428 \reserved@a{'\a}{'\z}

```

All the characters in the range 0–31 and 127–255 are illegal, *except* tab (\textasciitilde I), nl (\textasciitilde J), ff (\textasciitilde L) and cr (\textasciitilde M).

87.7 Lccodes and uccodes

We now again set up the default (T1) uc/lccodes. The lower case characters need their `\uccode` and `\lccode` values set. Some of this is a repeat of the set-up before loading hyphenation files. Depending on the \TeX version, we might not be allowed to do this for non-ASCII characters. For the Unicode engines (\XeTeX and \LuaTeX) there is no need to do any of this: they use hyphenation data which does not alter any of the set up and so this entire block is skipped.

```

429 \ifnum 0%
430   \ifx\Umathcode\@undefined\else 1\fi
431   \ifx\XeTeXmathcode\@undefined\else 1\fi
432   >\z@
433 \else
434 \def\reserved@c#1{%
435   \count@=#1\advance\count@ by -"20
436   \uccode#1=\count@
437   \lccode#1=#1
438 }

```

```

439 \reserved@a{'\a}{'\z}
440 \reserved@a{"A0}{\BC}
441 \reserved@a{"E0}{\FF}

```

The upper case characters need their \uccode and \lccode values set, and their \sfcode set to 999.

```

442 \def\reserved@c#1{%
443   \count@=#1\advance\count@ by "20
444   \uccode#1=#1
445   \lccode#1=\count@
446   \sfcode#1=999
447 }
448 \reserved@a{'\A}{'\Z}
449 \reserved@a{"80}{\9C}
450 \reserved@a{"C0}{\DF}

```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose uccode or lccode isn't quite what you'd expect.

```

451 \uccode'\^^Y='I      % dotless i
452 \lccode'\^^Y='^^Y    % dotless i
453 \uccode'\^^Z='J      % dotless j, ae in OT1
454 \lccode'\^^Z='^^Z    % dotless j, ae in OT1
455 \lccode'\^^9d='i     % dotted I
456 \uccode'\^^9d='^^9d % dotted I
457 \lccode'\^^9e='^^9e % d-bar
458 \uccode'\^^9e='^^d0 % d-bar

```

Finally here is one that helps hyphenation in the OT1 encoding.

```

459 \lccode'\^^[='^^[    % oe in OT1
460 \fi % End of reset block for 8-bit engines

```

\MakeUppercase And whilst we're doing things with uc/lc tables, here are two commands to upper- and lower-case a string.

\MakeUppercase

\@uclclist

Note that this implementation is subject to change! At the moment we're not providing any way to extend the list of uc/lc commands, since finding a good interface is difficult. These commands have some nasty features, such as uppercasing mathematics, environment names, labels, etc. A much better long-term solution is to use all-caps fonts, but these aren't generally available.

```

461 \DeclareRobustCommand{\MakeUppercase}[1]{%
462   \def\i{I}\def\j{J}%
463   \def\reserved@a##1##2{\let##1##2\reserved@a}%
464   \expandafter\reserved@a\@uclclist\reserved@b{\reserved@b\@gobble}%

```

Tell UTF-8 processing to process chars even though we are in an \protected@edef.

```

465   \let\UTF@two@octets@noexpand\@empty
466   \let\UTF@three@octets@noexpand\@empty
467   \let\UTF@four@octets@noexpand\@empty
468   \protected@edef\reserved@a{\uppercase{#1}}%
469   \reserved@a
470 }
471 \DeclareRobustCommand{\MakeLowercase}[1]{%
472   \def\reserved@a##1##2{\let##2##1\reserved@a}%
473   \expandafter\reserved@a\@uclclist\reserved@b{\reserved@b\@gobble}%
474   \let\UTF@two@octets@noexpand\@empty

```

```

480 \def\@uclclist{\oe\OE\o\O\ae\AE
481 \dh\DH\dj\DJ\l\L\ng\NG\ss\SS\th\TH}

```

```
\markboth{\MakeUppercase\contentsname}
         {\MakeUppercase\contentsname}
```

\mark{\protect\MakeUppercase Table of Contents}
{\protect\MakeUppercase Table of Contents}

```
482 \protected@edef\MakeUppercase#1{\MakeUppercase{#1}}
483 \protected@edef\MakeLowercase#1{\MakeLowercase{#1}}
```

Patch file code removed.

The code below adds the ‘patch level’ string to the first `\typeout` in the startup banner.

622

87.11 Initialise file list

`\@providesfile` Initialise for use in the document. During `initex` a modified version has been used which leaves debugging information for `latexbug.tex`.

```
538 \def\@providesfile#1[#2]{%
539     \wlog{File: #1 #2}%
540     \expandafter\xdef\csname ver@#1\endcsname{#2}%
541     \endgroup}
```

`\@filelist` Reset `\@filelist` so files input while making the format are not listed. The list built up so far may take up a lot of memory and so it is moved to `\reserved@a` where it will be overwritten as soon as almost any L^AT_EX command is issued in a class file. However the `latexbug.tex` program will be able to access this information and insert it into a bug report.

```
542 \let\@filelist\@gobble
543 \def\@addtofilelist#1{\xdef\@filelist{\@filelist,#1}}%
```

87.12 Some last minute initializations ...

This initializes the 2020/02/02 extensions to NFSS after any changes in the preamble.

```
544 \AtBeginDocument{\reinstall@nfss@defs\init@series@setup}
```

87.13 Do some temporary work for pre-release

This is a good place to load code that hasn't yet been integrated into the other files ...

```
545 %\input ...
```

87.14 Dumping the format

Finally we make `@` into a letter, ensure the format will be in the 'normal' error mode, and dump everything into the format file.

```
546 \makeatother
547 \errorstopmode
548 \dump
549 </2ekernel>
```

Change History

1985-11-04 ltmath.dtx LaTeX2.09		
General: produce warning message if line extends into margin. Doesn't warn about formula overprinting equation number.	354	
1989-04-10 ltffssbas.dtx v1.0a		
General: Starting with version numbers! <code>\ifmmode</code> added in <code>\math@group</code>	154	
1989-04-10 ltffssbas.dtx v1.0b		
General: <code>\preload@sizes</code> added.	154	
<code>\wrong@fontshape</code> changed to define substitution font/shape macro.	154	
1989-04-10 ltffssini.dtx v1.0a		
General: Starting with version numbers <code>\newif</code> for <code>\@tempswa</code> added since this switch is unknown at the time when this file is read in. (latex.tex is loaded later.) <code>\math@famname</code> changed to <code>\math@version</code> . .	245	
1989-04-14 ltffssbas.dtx v1.0c		
General: More documentation added.	154	
1989-04-15 ltffssini.dtx v1.0b		
General: <code>\mathfontset</code> renamed to <code>\mathversion</code>	245	
1989-04-19 ltffssbas.dtx v1.0d		
General: Even more doc.	154	
1989-04-21 ltffssbas.dtx v1.0e		
General: Documentation is fun! Parameters of <code>\define@mathalphabet</code> changed.	154	
1989-04-21 ltffssini.dtx v1.0c		
General: Changed to conform to fam.tex.	245	
1989-04-23 ltffssbas.dtx v1.0f		
General: % in <code>\getanddefinefonts</code> added.	154	
1989-04-26 ltffssini.dtx v1.0d		
General: <code>\xpt</code> added.	245	
1989-04-27 ltffssbas.dtx v1.0g		
General: Documentation revised.	154	
1989-04-27 ltffssini.dtx v1.0e		
General: Definitions of L ^A T _E X symbols corrected.	245	
1989-04-29 ltffssbas.dtx v1.0h		
General: Documented problem with <code>\halign</code> , and <code>\noalign</code>	154	
<code>\mathversion</code> : Test if version defined added.	163	
1989-04-29 ltffssbas.dtx v1.0i		
General: Removed the <code>\halign</code> <code>\noalign</code> correction (wasn't bugfree)	154	
1989-04-29 ltffssini.dtx v1.0f		
General: Corrections to L ^A T _E X tabular env. added.	245	
1989-05-01 ltffssbas.dtx v1.0j		
General: Default for <code>\baselinestretch</code> added. . .	154	
1989-05-22 ltffssbas.dtx v1.0k		
General: Lines longer than 72 characters folded.	154	
1989-05-22 ltffssini.dtx v1.0g		
General: Lines shortened to 72 characters	245	
1989-09-14 ltffssbas.dtx v1.0m		
General: Global replacement: <code>\group</code> to <code>\mathgroup</code>	154	
<code>\mathversion</code> : Corrected typo: <code>\endscname</code> to <code>\endcsname</code> . .	163	
1989-11-07 ltffssini.dtx v1.0i		
General: All family, series, and shape names abbreviated. . .	245	
1989-11-08 ltffssbas.dtx v1.0o		
General: First parameter of <code>\define@mathalphabet</code> and <code>\define@mathgroup</code> changed from string to control sequence.	154	
1989-11-14 ltffssbas.dtx v1.0p		
<code>\math@version</code> : Math version prefix 'mv@' added.	163	
1989-11-19 ltffssbas.dtx v1.0q		
<code>\define@newfont</code> : Group added.	164	
<code>\wrong@fontshape</code> : Instead of calling <code>\family\default@family</code> , etc. we directly set <code>\f@family</code> , etc.	169	
1989-11-22 ltffssbas.dtx v1.0r		
<code>\math@version</code> : <code>\def</code> → <code>\edef</code> for <code>\math@version</code>	163	
1989-11-25 ltffssbas.dtx v1.0s		
General: All <code>\edef\font@name</code> changed to <code>\xdef\font@name</code> .		

Necessary after introduction of <code>\begingroup/\endgroup</code> in v1.0q.	154	1990-01-21 ltfssstrc.dtx v1.2b <code>\use@mathgroup</code> : Macro added to allow cleaner interface.	203
extra// \rightarrow + in <code>\extra@def</code>	154	1990-01-23 ltfssbas.dtx v1.2c General: <code>\no@version@warning</code> renamed to <code>\no@alphabet@error</code>	154
1989-11-26 ltfssbas.dtx v1.0t <code>\select@group:\bgroup/\egroup</code> changed to <code>\begingroup/\endgroup</code> to avoid empty Ord atom on math list.	171	Macro <code>\no@alphabet@help</code> added	154
1989-12-02 ltfssini.dtx v1.1b General: <code>\rmmath</code> renamed to <code>\mathrm</code>	245	<code>\no@alphabet@error</code> : Changed to error call	154
1989-12-03 ltfssini.dtx v1.1c General: Some internal macros renamed to make them inaccessible.	245	1990-01-25 ltfssini.dtx v1.1e <code>\nfss@text</code> : Macro added.	258
1989-12-05 ltfssbas.dtx v1.0u <code>\addto@hook:\addto@hook</code> added.	176	1990-01-27 ltfssbas.dtx v1.2d <code>\DeclarePreloadSizes</code> : Font identifier set to <code>\relax</code>	159
1989-12-05 ltfssstrc.dtx v1.0u fam.dtx <code>\every@math@size</code> : Hook <code>\every@size</code> added.	200	1990-01-28 ltfssbas.dtx v1.2e <code>\mathgroup:\newfam</code> let to <code>\new@mathgroup</code>	154
1989-12-13 ltfssstrc.dtx v1.0f <code>\use@mathgroup:\expandafter</code> added before final <code>\fi</code>	203	1990-01-28 ltfssbas.dtx v1.2f <code>\define@newfont</code> : Added call to <code>\curr@fontshape</code> macro to allow substitution.	165
1989-12-16 ltfssbas.dtx v1.1a <code>\select@group:\relax</code> in front added.	171	<code>\wrong@fontshape</code> : Warning message slightly changed.	169
Now four arguments.	171	1990-01-28 ltfssini.dtx v1.2b <code>\em</code> : Call to <code>\@nomath</code> added.	256
Redefinition of alphabet now simpler.	172	1990-02-08 ltfssini.dtx v1.1g General: Protected the commands <code>\family</code> , <code>\series</code> , <code>\shape</code> , <code>\size</code> , <code>\selectfont</code> , and <code>\mathversion</code>	245
Usage of ‘=’ macro added.	172	1990-02-16 ltfssbas.dtx v1.2g General: Support for changes of <code>\baselineskip</code> without changing the size.	154
1989-12-16 ltfssstrc.dtx v1.1a <code>\selectfont</code> : Changed order of calls.	197	<code>\math@version:\@nomath</code> added.	163
<code>\use@mathgroup</code> : Redefinition of alphabet now simpler.	203	1990-02-16 ltfssstrc.dtx v1.0i <code>\selectfont</code> : Changed <code>\f@size</code> to <code>\lcl@currsz</code> (see fam file).	197
Usage of ‘=’ macro added.	203	1990-02-18 ltfssstrc.dtx v1.0j General: Redefine unprotected version <code>\p@selectfont</code> instead of <code>\selectfont</code>	197
1990-01-18 ltfssstrc.dtx v1.0h General: <code>\tracingfonts</code> meaning changed.	193	1990-03-14 ltfssstrc.dtx v1.0k General: Added code for TeX3.	193
1990-01-20 ltfssbas.dtx v1.2a <code>\math@bgroup</code> : Def. placed in this file.	173	<code>\extract@font</code> : Added code for TeX3.	196
<code>\math@egroup</code> : Def. placed in this file.	173	<code>\selectfont</code> : Added code for TeX3.	197
<code>\select@group</code> : Def for alph id changed.	172	1990-03-30 ltfssbas.dtx v1.2h <code>\math@egroup</code> : Changed to have one arg.	173
1990-01-21 ltfssbas.dtx v1.0b <code>\select@group</code> : Code moved to <code>\use@mathgroup</code>	172		

1990-03-30 ltfssstrc.dtx v1.2h		1990-08-27 ltfssstrc.dtx 1.0r	
<code>\use@mathgroup</code> : Third argument removed (see <code>\math@egroup</code>).	203	<code>\type@restoreinfo</code> : Some extra tracing info.	199
1990-04-01 ltfssbas.dtx v1.2i		1990-08-27 ltfssstrc.dtx v1.0r	
General: Code added from		<code>\getanddefine@fonts</code> : Correcting missing name after	
tracefnt.dtx.	154	<code>\tracingon</code>	204
Support for TeX3.	154	1991-03-28 ltfssini.dtx v1.1m	
1990-04-01 ltfssstrc.dtx v1.0l		<code>\copyright</code> : Extra braces added.	258
General: Part of code moved to		1991-03-30 ltfssini.dtx v1.2g	
fam.dtx.	193	<code>\newfont</code> : Definition added.	257
<code>\tracingfonts</code> : Check if		<code>\symbol</code> : Definition added.	257
<code>\tracingfonts</code> already defined.	194	1991-07-24 ltmiscen.dtx LaTeX2.09	
1990-04-01 ltfssstrc.dtx v1.0o		<code>\@verbatim</code> : Added	
<code>\tracingfonts</code> : Check if		<code>\penalty\interlinepenalty</code>	
<code>\tracingfonts</code> defined		to definition of <code>\par</code> so that	
removed again.	194	<code>\samepage</code> works	341
1990-04-02 ltfssini.dtx v1.1i		1991-08-14 ltmath.dtx LaTeX2.09	
General: <code>\input</code> of files now		<code>\cases</code> : (RmS) inserted extra	
handled by docstrip.	245	braces around entry for NFSS	350
1990-04-05 ltfssstrc.dtx v1.0m		1991-08-14 ltpictur.dtx LaTeX2.09	
<code>\selectfont</code> : Call <code>\tracingon</code>		General: (RmS) inserted extra	
only if <code>\tracingfonts</code> greater		braces around entry for NFSS	412
than 3.	197	1991-08-14 ltthm.dtx LaTeX2.09	
1990-05-05 ltfssstrc.dtx v1.0n		<code>\@endtheorem</code> : Moved <code>\itshape</code>	
<code>\selectfont</code> : <code>\tracingon</code> with		after <code>\item</code> to make it work	
new syntax.	197	with NFSS	435
1990-06-23 ltfssini.dtx v1.1k		1991-08-26 ltfssini.dtx v1.1n	
<code>\nfss@text</code> : Changed to <code>\mbox</code>	258	<code>\reset@font</code> : Macro introduced	258
1990-06-24 ltfssbas.dtx v1.2j		1991-08-26 ltmiscen.dtx LaTeX2.09	
<code>\DeclarePreloadSizes</code> : Missing		<code>\@verbatim</code> : <code>\@@par</code> added	341
percent added.	158	1991-08-26 ltpictur.dtx LaTeX2.09	
1990-06-24 ltfssstrc.dtx v1.0o		<code>\endpicture</code> : (RmS & FmI) extra	
<code>\baselinestretch</code> : Moved to		boxing level around <code>\@picbox</code>	
tracefnt.dtx.	200	to guard against unboxing in	
<code>\getanddefine@fonts</code> : <code>\Adding</code>		math mode (proposed by John	
tracing code.	204	Hobby)	411
<code>\Macro</code> moved from fam.dtx.	204	1991-08-26 ltplain.dtx LaTeX2.09	
Adding debug code.	204	<code>\tracingall</code> : Added <code>\errorcon-</code>	
<code>\use@mathgroup</code> : Tracing code		<code>textlines=\maxdimen</code> ,	
added.	203	suggested by J. Schrod	30
1990-06-30 ltfssbas.dtx v1.2l		1991-09-29 ltboxes.dtx LaTeX2.09	
<code>\showhyphens</code> : Macro added.	174	<code>\@mpfootnotetext</code> : (RmS) added	
1990-06-30 ltfssstrc.dtx v1.0p		<code>\reset@font</code>	384
<code>\use@mathgroup</code> : Added <code>\relax</code>		1991-09-29 ltfloat.dtx LaTeX2.09	
after math group number.	203	<code>\@footnotetext</code> : (RmS) added	
1990-07-07 ltfssstrc.dtx v1.0q		<code>\reset@font</code>	465
<code>\getanddefine@fonts</code> : Group		1991-09-29 ltmath.dtx LaTeX2.09	
number added to tracing.	204	<code>\@eqnnum</code> : RmS: <code>\reset@font</code>	
<code>\math@egroup</code> : Tracing code		added.	353
added.	203	1991-09-29 ltsect.dtx LaTeX2.09	
<code>\use@mathgroup</code> : Group number		<code>\@dottedtocline</code> : (RmS) added	
added to tracing.	203	<code>\reset@font</code> for page number	446

1991-10-17 ltcntrl.dtx LaTeX2.09	1992-01-10 ltbibl.dtx LaTeX2.09
\@tfor: (Rms) \xdef replaced by	\@bibitem: Changed \c@enumiv to

<code>\try@size@range:</code>	210	<code>\not@math@alphabet:</code> Macro	
<code>\use@mathgroup:</code>	203	defined.	257
1992-08-14 ltbibl.dtx LaTeX2.09		1992-09-22 ltfssbas.dtx v1.91a	
<code>\@citex:</code> added missing argument		General: Introduced <code>\tf@size</code> for	
braces around <code>\hbox</code> , found by		math size.	154
Ed Sznyter	470	1992-09-22 ltfssstrc.dtx v2.1a	
1992-08-14 ltboxes.dtx LaTeX2.09		<code>\getanddefine@fonts:</code> Introduced	
<code>\endminipage:</code> (RmS) replaced		<code>\tf@size</code> for math size.	204
<code>\vskip</code> - <code>\lastskip</code> by <code>\unskip</code>		1992-11-13 ltfssini.dtx v?	
(proposed by FMi)	383	<code>\hexnumber@:</code> Made expandable.	258
1992-08-17 ltbibl.dtx LaTeX2.09		1992-11-23 ltcounts.dtx LaTeX2.09	
<code>\@citex:</code> simplified code for		<code>\stepcounter:</code> Replaced <code>{}</code> in	
removing leading blanks in		<code>\stepcounter</code> by <code>\begingroup</code>	
citation key (proposed by		<code>\endgroup</code> to avoid adding an	
Frank Jensen and Kresten		empty ord in math mode	147
Krab Thorup)	470	1992-11-26 ltboxes.dtx LaTeX2.09	
1992-08-19 ltsect.dtx 0.0		<code>\@mpfootnotetext:</code> (RmS) added	
<code>\@xsect:</code> (RmS) corrected bug:		protection for <code>\edef</code>	384
stretch and shrink in argument		1992-11-26 ltfloating.dtx LaTeX2.09	
to <code>\hskip</code> previously not		<code>\@footnotetext:</code> (RmS) added	
negated	441	protection for <code>\edef</code>	465
1992-08-19 lthtm.dtx LaTeX2.09		<code>\footnote:</code> (RmS) Changed all to	
<code>\@othm:</code> (RmS) Changed error		<code>'def'protect'noexpand'protect'noexpand</code>	
message to complain about		465
undefined counter	434	1992-12-03 ltfssini.dtx v?	
1992-08-20 ltfssini.dtx v1.4b		<code>\hexnumber@:</code> Make it accept	
<code>\@setsize:</code> Added <code>\@currsiz</code>	258	counters.	258
1992-08-24 ltdefns.dtx LaTeX2.09		1993-03-08 preload.dtx v2.0b	
<code>\@ifnextchar:</code> (Rms)		General: Added 12pt preloads	282
<code>\@ifnextchar</code> didn't work if its		1993-03-18 ltfssbas.dtx v2.0c	
first argument was an equal		General: Changed all <code>\@tempdima</code>	
sign.	50	in <code>\@tempdimb</code> to avoid killing	
1992-08-24 ltmiscen.dtx LaTeX2.09		<code>\numberline</code>	154
<code>\begin:</code> Added code to <code>\begin</code> to		1993-03-18 ltfssstrc.dtx v2.1b	
remember line number. Used		General: Changed all <code>\@tempdima</code>	
by <code>\@badend</code> to display position		in <code>\@tempdimb</code> to avoid killing	
of non-matching <code>\begin</code>	336	<code>\numberline</code>	193
<code>\verb:</code> Changed <code>\verb</code> and		Changed all <code>\@tempdimb</code> in	
<code>\@sverb</code> to work correctly in		<code>\@tempdimx</code> to avoid killing	
math mode	344	<code>\numberline</code>	193
1992-08-25 ltsect.dtx LaTeX2.09		1993-03-18 ltfssstrc.dtx v2.1c	
<code>\@sect:</code> (FMi) replaced explicit		<code>\DeclareSizeFunction:</code> Added all	
setting of <code>\@svsec</code> by call to		args to avoid blanks problems	209
<code>\@secntformat</code>	440		

1993-04-09 ltterror.dtx v1.0e		message of <code>\SetSymbolFont</code>	228
<code>\@latexerr</code> : Mention The Companion	65	1993-09-02 ltfsstrc.dtx v2.1i	
1993-04-11 ltterror.dtx v1.0f		General: Corrected name of sgen size function.	193
<code>\@latexerr</code> : Remove setting of errorcontextlines	65	1993-09-03 ltmiscen.dtx LaTeX2.09	
1993-05-05 ltfntcmd.dtx v2.0b		<code>\verbatim@nolig@list</code> : Replaced <code>\@noligs</code> by extensible list	345
General: Removed all LaTeX related cmds	286	1993-09-07 ltmiscen.dtx LaTeX2.09	
1993-05-16 ltfsbas.dtx v2.0e		<code>\verb@balance@group</code> : (RmS) Changed definition of <code>\verb</code> so that it detects a missing second delimiter.	344
<code>\showhyphens</code> : Use <code>\reset@font</code>	174	1993-09-08 ltmiscen.dtx LaTeX2.09	
1993-07-16 ltfsstrc.dtx v2.1h		<code>\enddocument</code> : Added warning in case of undefined references.	332
General: Changed layout of info messages	193	1993-09-15 ltfsbas.dtx v2.0g	
1993-07-17 ltoutenc.dtx 1.0d		<code>\DeclareFontEncoding</code> : Corrected: <code>\default@T</code> to <code>\default@M</code>	157
General: changed <code>\catcoding @</code>	105	1993-09-15 ltfsstrc.dtx v2.1j	
1993-08-03 ltmiscen.dtx LaTeX2.09		General: Corrected spelling of <code>\noexpand</code>	193
<code>\enddocument</code> : Changed redefinition of <code>\global</code> to redefinition of <code>\@setckpt</code>	332	1993-09-19 ltterror.dtx LaTeX2.09	
1993-08-05 ltpictur.dtx LaTeX2.09		<code>\@invalidchar</code> : (RmS) Error message for invalid input characters.	67
<code>\circle</code> : (RMS) Added error message if <code>\circle</code> is used in math mode.	427	1993-11-02 ltmath.dtx LaTeX2.09	
1993-08-05 ltsect.dtx LaTeX2.09		General: RmS: Corrected description of <code>\@eqnset</code> , moved <code>\@eqnset</code> accordingly and removed extra <code>\tabskip</code> assignment.	354
<code>\@sect</code> : (RmS) Made sure that <code>\protect</code> works correctly in expansion of <code>\the counter</code>	440	1993-11-03 ltmath.dtx LaTeX2e	
1993-08-05 ltspace.dtx LaTeX2e		General: RmS: Initialized <code>\everycr</code> to empty	354
<code>\@hspace</code> : (RmS) Removed superfluous <code>\leavevmode</code> in <code>\@hspace</code> and <code>\@hspacer</code> , as suggested by CAR.	85	1993-11-03 ltpictur.dtx LaTeX2.09	
1993-08-05 lttab.dtx latex2e		General: (RmS) changed <code>\halign</code> to <code>\ialign</code> to initialize <code>\tabskip</code> and <code>\everycr</code>	412
<code>\tabular*</code> : Replaced <code>\expandafter\def</code> by <code>\@namedef</code>	398	1993-11-11 ltfsini.dtx v2.1a	
1993-08-06 ltbibl.dtx LaTeX2.09		<code>\normalfont</code> : Macro added	258
<code>\@citex</code> : Moved writing to .aux file in loop over citation keys so that leading blanks are removed there as well.	470	1993-11-11 ltfsstrc.dtx v2.2a	
1993-08-13 ltoutenc.dtx 1.0f		General: Option concept added for LaTeX2e	193
General: Protected against active <code>@</code> sign.	105	1993-11-14 ltclass.dtx v0.2a	
1993-08-13 preload.dtx v2.0c		<code>\@current</code> : Name changed from <code>\@currentextension</code>	553
General: Added <code>\relax</code> at end of font names.	283	<code>\@fileswithoptions</code> : Moved resetting of <code>\default@ds</code> , <code>\ds@</code> and <code>\@declaredoptions</code> here, from the end of <code>\ProcessOptions</code>	563
1993-08-16 ltoutenc.dtx 1.0g		<code>\@reset@options</code> : macro added	565
General: Needs space after <code>\string</code>	105	<code>\AtEndDocument</code> : Included extension in the generated	
1993-08-18 ltfsdcl.dtx v2.0e			
<code>\new@mathversion</code> : Exchanged names of encodings in warning			

macro name for package and class hooks.	565	1993-11-22 ltclass.dtx v0.2f	
\documentstyle: Added		\@fileswithoptions: Made the default [] not	
\RequirePackage		[\@unknownversion]	562
\@unusedoptionlist stuff. . .	560	Made the initial version [] not	
\g@addto@macro: Made global . .	565	[\@unknownversion]	563
\NeedsTeXFormat: made more robust for alternative syntax for other formats.	561	\@ifclasslater: Added //00 so parsing never produces a runaway argument.	554
\ProcessOptions*: Optimise 'empty option' code.	558	General: \@unknownversion removed	548
Stop adding the global option list inside class files.	558	1993-11-22 ltdefs.dtx LaTeX2e	
1993-11-15 ltclass.dtx v0.2b		\@minus: Macro added	36
\documentstyle: Modified to match \ProcessOption* . . .	560	\@plus: Macro added	36
\ProcessOptions*: Star form added.	558	\CheckCommand: Macro added . . .	43
1993-11-17 ltclass.dtx v0.2c		\providecommand: Macro added . .	43
\@@fileswith@pti@ns: Macro added	565	1993-11-22 lterror.dtx LaTeX2e	
\@badrequireerror: Macro added	566	\c@errorcontextlines: Macro added	64
\@fileswithoptions: Added trap for two \LoadClass commands.	564	1993-11-22 ltfiles.dtx LaTeX2e	
\@twoloadclasserror: Macro added	566	\listfiles: Removed checking for \@unknownversion	100
\CurrentOption: Name changed from \@curroption	553	1993-11-22 llength.dtx LaTeX2e	
\DeclareOption*: Error checking added	557	\@settodim: Macro added	153
\NeedsTeXFormat: Name changed from \NeedsFormat	561	\@settopoint: Macro added	153
\ProcessOptions*: restoring \@fileswith@pti@ns added.	558	\settodepth: Macro added	153
1993-11-18 ltclass.dtx v0.2d		\settoheight: Macro added	153

		\two@digits: Macro added	36

1993-11-23 ltoutput.dtx v0.1a		<code>\@imakebox</code> : macro modified ... 376
<code>\paperheight</code> : Register added ... 488		<code>\@irsbox</code> : redefined to support
<code>\paperwidth</code> : Register added ... 488		<code>\height</code> 385
1993-11-23 ltoutput.dtx v0.1c		<code>\@isavebox</code> : color support 378
<code>\@enlargepage</code> : Command added 531		extra group 378
<code>\@kludgeins</code> : Insert added 531		<code>\@isavepicbox</code> : extra group 378
<code>\@makecol</code> : Command changed .. 499		<code>\@makebox</code> : default changed from x
<code>\@specialoutput</code> : Command		to c 376
changed 493		<code>\@makepicbox</code> : macro modified .. 377
<code>\enlargethispage*</code> : Commands		<code>\@savebox</code> : default c not x 378
added 531		<code>\bm@b</code> : macros added 376
1993-11-24 ltfntcmd.dtx v2.1a		<code>\endlrbox</code> : macro added 378
<code>\maybe@ic@</code> : Use <code>\t@st@ic</code> 291		<code>\fbox</code> : extra group 379
<code>\t@st@ic</code> : Macro added 291		<code>\lrbox</code> : color support 378
1993-11-24 ltfssini.dtx v2.1a		macro added 378
General: Removed <code>\xpt</code> stuff ... 258		<code>\makebox</code> : modified 375
1993-11-24 ltlogos.dtx LaTeX2e		<code>\mbox</code> : extra group 376
<code>\LaTeX</code> : Macro changed 87		<code>\minipage</code> : Redefined to support
1993-11-28 ltclass.dtx v0.2h		extra optional arguments ... 383
<code>\@twoclasseserror</code> : Macro added 566		<code>\newsavebox</code> : Pass the whole of
General: Assorted commands now		arg 1 to <code>\@ifdefinable</code> 377
in the kernel removed. 552		<code>\parbox</code> : Redefined to support
Directory syntax checing moved		extra optional arguments ... 380
to <code>dircheck.dtx</code> 552		<code>\raisebox</code> : redefined to support
Primitive filenames now		<code>\height</code> 385
terminated by space not		<code>\sbox</code> : color support 378
<code>\relax</code> 552		extra group 378
<code>\endfilecontents</code> : Don't globally		<code>\set@color</code> : color support 377
allocate a write stream (always		macro added 377
use 15) 566		1993-12-03 ltclass.dtx v0.2i
1993-11-28 ltfiles.dtx LaTeX2e		<code>\@cls@pkg</code> : Name changed to avoid
<code>\@missingfileerror</code> : Use filename		clash with output routine. ... 565
parser from <code>dircheck</code> 99		General: <code>\@onlypreamble</code> : Many
1993-11-29 ltoutput.dtx v1.0b		commands declared. 552
<code>\@makecol</code> : <code>\@makespecialcolbox</code>		Removed obsolete
added 499		<code>\@documentclass</code> 552
<code>\@makespecialcolbox</code> : Command		1993-12-03 lterror.dtx v1.0b
added 501		<code>\@latexerr</code> : Set
1993-11-29 ltplain.dtx LaTeX2e		<code>\@errorcontextlines</code> to -1 . 65
General: All accents in decimals;		1993-12-03 ltfssini.dtx v2.1a
suggested by Paul Taylor 29		General: update for LaTeX2e ... 245
1993-11-30 ltoutput.dtx v1.0c		1993-12-04 ltfiles.dtx v0.9b
<code>\fl@tracemessage</code> : Commands		<code>\@iinput</code> : Macro reimplemented . 99
added 533		<code>\@input</code> : Macro reimplemented . 99
1993-12-01 fontdef.dtx v2.1a		<code>\IfFileExists@</code> : Macro added .. 97
General: Update for LaTeX2e ... 262		<code>\input</code> : Macro reimplemented .. 98
1993-12-01 ltoutput.dtx v1.0e		<code>\InputIfFileExists</code> : Macro
<code>\@reinserts</code> : Command added . 500		added 98
1993-12-03 ltboxes.dtx v0.1a		1993-12-05 ltfloat.dtx LaTeX2e
<code>\@argsbox</code> : macro removed 385		<code>\@dblfloatplacement</code> : Command
<code>\@begin@tempboxa</code> : macro added 376		changed 457
<code>\@end@tempboxa</code> : macro added .. 376		<code>\@xfloat</code> : Command changed .. 452
<code>\@iirsbox</code> : redefined to support		1993-12-05 ltoutput.dtx v1.0f
<code>\height</code> 385		<code>\@addtobot</code> : Command changed . 513

<code>\@addtocurcol</code> : Command	1993-12-07 ltclass.dtx v0.2m
changed 514	<code>\@fileswithoptions</code> : Reset
<code>\@addtodblcol</code> : Command	<code>\CurrentOption</code> 563
changed 525	1993-12-07 ltoutenc.dtx 1.1
<code>\@addtonextcol</code> : Command	General: Protected all special
changed 521	characters with <code>\string</code> 105
<code>\@addtotoporbot</code> : Command	1993-12-07 ltoutenc.dtx v1.1
changed 513	General: Made all character
<code>\@boxfpsbit</code> : Command added . 536	numbers decimal. 102
<code>\@flcheckspace</code> : Command	Removed a lot of equal signs
added 538	and the like. 102
<code>\@flsetnum</code> : Command added . . 537	1993-12-08 ltboxes.dtx v0.1b
<code>\@flsettextmin</code> : Command	<code>\@begin@tempboxa</code> : Extra braces
added 538	for color support (braces
<code>\@flstop</code> : Commands added . . . 534	removed from other macros) 376
<code>\@flupdates</code> : Command added . 539	<code>\@irsbox</code> : fix typo 385
<code>\@fpsadddefault</code> : Command	<code>\@parboxto</code> : <code>\endgraf</code> added due
added 535	to extra group in
<code>\@getfpsbit</code> : Command added . 536	<code>\@begin@tempboxa</code> 381
<code>\@opcol</code> : Command changed . . . 499	<code>\lrbox</code> : move <code>\@endpefalse</code> out of
Hook added 499	the inner group 378
<code>\@outputpage</code> : Command	1993-12-08 ltfntcmd.dtx v2.1b
changed 503	General: Macros <code>\rm</code> , <code>\bf</code> and <code>\sf</code>
<code>\@resethfps</code> : Command added . 537	moved to classes.dtx 293
<code>\@setfloattypecounts</code> : Command	1993-12-08 ltlists.dtx LaTeX2e
added 535	<code>\@item</code> : use <code>\sbox</code> to support
<code>\@setfpsbit</code> : Command added . 536	colour 371
<code>\@shipoutsetup</code> : Command	1993-12-08 ltspace.dtx LaTeX2e
added 503	<code>\@bsphack</code> : Command
<code>\@startcolumn</code> : Command	reimplemented 77
changed 508	Command reimplemented; late
<code>\@startdblcolumn</code> : Command	birthday present for Chris . . . 77
changed 508	<code>\@vbsphack</code> : Command added . . 80
<code>\@testfp</code> : Command added 536	1993-12-09 ltboxes.dtx v0.1c
<code>\@textfloatsheight</code> : Commands	<code>\@irsbox</code> : fix another typo 385
added 535	1993-12-09 ltclass.dtx v0.2n
<code>\@topnewpage</code> : Commands	<code>\documentstyle</code> : input 209
changed 491	compatibility file. 560
<code>\@tryfcolumn</code> : Command	1993-12-09 ltfiles.dtx v0.9e
changed 510	<code>\document</code> : Hook added 90
<code>\@writesetup</code> : <code>\@startpagehook</code>	1993-12-09 ltmiscen.dtx v0.9e
added 503	<code>\enddocument</code> : Hook added 332
<code>\output</code> : Command changed . . . 493	1993-12-10 ltoutenc.dtx v1.2
1993-12-06 ltclass.dtx v0.2k	General: Added source code for
<code>\ExecuteOptions</code> : Preserve	<code>tlenc.sty</code> 102
<code>\CurrentOption</code> 559	1993-12-11 ltfntcmd.dtx v3.0a
1993-12-06 ltoutput.dtx v1.0f	General: Complete reworking of all
<code>\@specialoutput</code> : Unboxing of 255	text commands, using just one
added to rescue writes 493	creator function 286
1993-12-06 ltoutput.dtx v1.0g	italic correction now put in front
<code>\@topnewpage</code> : <code>\@floatplacement</code>	of penalty before glue 286
placement bug fixed 491	newcommands replaced by defs 286
1993-12-07 ltclass.dtx v0.2l	newfontswitch command
<code>\ProvidesFile</code> : Macro added . . . 557	corrected and changed 286

<code>\DeclareTextFontCommand</code> : Macro changed	288	<code>\IfFileExists</code> : Removed interactive prompting for current directory syntax	10
<code>\emph</code> : Macro changed	289	<code>\strip@prefix</code> : modified, name changed from <code>\stripmeaning</code> . . .	5
<code>\fix@penalty</code> : Macro added	292	1993-12-13 ltlists.dtx latex2e	
<code>\maybe@ic</code> : Macro name changed	291	<code>\trivlist</code> : Initialised	
<code>\maybe@ic@</code> : Macro and name changed	291	<code>\@itemlabel</code>	368
<code>\sw@slant</code> : Macro changed	292	1993-12-13 ltmiscen.dtx v0.9h	
<code>\textup</code> : Macros changed	289	<code>\@noligs</code> : Readded <code>\@noligs</code> . . .	345
1993-12-11 ltmath.dtx v0.9g		<code>\@verbatim</code> : Readded <code>\@noligs</code> .	342
General: Added a group around the first argument of <code>\frac</code> to prevent changes (for example font changes) from modifying the contents of the second argument.	354	Removed optional argument of <code>\item</code>	341
1993-12-11 ltoutenc.dtx v1.2a		<code>center</code> : Removed optional argument of <code>\item</code>	340
General: Corrected for <code>tlenc</code> , <code>math</code>	102	<code>flushleft</code> : Removed optional argument of <code>\item</code>	340
1993-12-11 ltsect.dtx LaTeX2e		<code>flushright</code> : Removed optional argument of <code>\item</code>	340
<code>\author</code> : Added default	436	1993-12-13 ltoutenc.dtx v1.2b	
<code>\title</code> : Added default	436	General: Corrected file name in driver code.	102
1993-12-11 ltxref.dtx LaTeX2e		1993-12-13 lttab.dtx latex2e	
<code>\@setref</code> : Macro added	329	<code>\tabbing</code> : Removed optional argument of <code>\item</code>	393
<code>\pageref</code> : Macro reimplemented .	329	1993-12-14 ltoutput.dtx v1.0i	
<code>\ref</code> : Macro reimplemented	329	General: Section added to declare all parameters	544
1993-12-12 ltoutput.dtx v1.0h		1993-12-15 ltboxes.dtx v0.1d	
<code>\@cflb</code> : <code>boxmaxdepth</code> setting moved	507	<code>\@iminipage</code> : Changed default from ‘c’ to ‘s’	383
defs changed to <code>lets</code>	507	<code>\@iparbox</code> : Changed default from ‘c’ to ‘s’	381
<code>\@cflt</code> : name changed	507	<code>\minipage</code> : Changed default from ‘c’ to ‘s’	383
<code>\@docclearpage</code> : defs changed to <code>lets</code>	498	extra space removed.	383
<code>\@makecol</code> : defs changed to <code>lets</code> .	500	<code>\parbox</code> : Changed default from ‘c’ to ‘s’	380
<code>\@resethfps</code> : Warnings added: minimal	537	1993-12-15 ltclass.dtx v0.2p	
<code>\@startdblcolumn</code> : defs changed to <code>lets</code>	509	General: Removed extra ‘.’s from <code>\@@warnings</code>	552
<code>\@topnewpage</code> : braces removed . .	491	1993-12-16 ltlogos.dtx LaTeX2e	
<code>\@tryfcolumn</code> : defs changed to <code>lets</code>	510	<code>\LaTeXe</code> : Extended logo by DPC	87
<code>\fl@tracemessage</code> : Commands changed	533	1993-12-16 ltmath.dtx v0.9i	
1993-12-13 ltclass.dtx v0.2o		<code>\@eqnocr</code> : use <code>\refstepcounter</code> instead of shortcut	355
General: Removed setting <code>\errorcontextlines</code> (now in <code>latex.tex</code>)	552	General: use <code>\refstepcounter</code> instead of shortcut	354
<code>\documentstyle</code> : compatibility file now <code>latex209.sty</code>	560	1993-12-16 ltmiscen.dtx v0.9i	
<code>\usepackage</code> : Fixed error handling	561	General: <code>\literal</code> added	345
1993-12-13 ltdirchk.dtx v0.2a		1993-12-16 ltpage.dtx LaTeX2e	
General: on the ‘docstrip’ pass, do not check <code>openin</code> path	10	<code>\mark</code> : Init <code>\mark</code> at begin document	475

1993-12-16 ltspace.dtx LaTeX2e	initializing mark until the problem is solved.	475
\@bsphack: Corrected optimisation :-)		77
1993-12-16 lttab.dtx latex2e		
\@xhline: Measure from middle of vertical rules		407
1993-12-17 ltclass.dtx v0.2q		
\@documentclasshook: Macro added		552
\@fileswithoptions: Add		
\@compatibility hook		562
\documentstyle: Match Alan's new code.		560
1993-12-17 ltoutenc.dtx 1.3		
General: Added this section		106
Removed all the hackery for use in \DeclareFontEncoding, and redid everything using \DeclareTextFoo.		118, 120
Removed the catcode hackery, since the file is only read as a package in the preamble, and removed all the messages on the screen, which just confuse users. Replaced them by the appropriate \ProvidesPackage commands. Added XXXenc.		105
1993-12-17 ltoutenc.dtx v1.3		
General: Added		
\EncodingSpecificAccent, \EncodingSpecificAccent-edLetter and \EncodingSpecificCommand.		102
Made Rokicki's encoding a proper encoding scheme rather than a variant of OT1.		102
1993-12-17 ltoutput.dtx v1.0j		
\@opcol: Hook removed		499
\@specialoutput: Page room test added		494
\@topnewpage: check for vsize too small added		491
Page room test added		493
\@writesetup: —and then removed		503
\fl@tracemessage: tracefloatvals made a document command		533
1993-12-17 ltpage.dtx LaTeX2e		
\mark: Removed init \mark at begin document, since it doesn't work.		475
\rightmark: Stopgap solution to mark \leftmark and \rightmark work without		
1993-12-18 ltoutenc.dtx 1.3b		
General: Fixed typos with \ProvidesPackage lines. Added the \NeedsTeXFormat line. Added the last argument to \DeclareEncoding. Moved the use of the encodings to after their declaration.		105
Replaced the missing last argument to \DeclareFontEncoding.		118, 120
1993-12-18 ltoutenc.dtx 1.3c		
General: Rewrote for the new syntax of \EncodingSpecific.		118, 120
Split \EncodingSpecificAccent up into \EncodingSpecific and \DeclareAccent.		106
1993-12-18 ltoutenc.dtx v1.3a		
General: Replaced OT3 by XXX		102
1993-12-18 ltoutenc.dtx v1.3b		
General: Corrected typos.		102
Replaced the missing last argument to \DeclareFontEncoding.		102
1993-12-18 ltoutenc.dtx v1.3c		
General: A new syntax, separating accent-definitions from encoding-specific definitions, and allowing encoding-specific \chardef, \let, etc.		102
Rewrote for the new syntax of \EncodingSpecific.		102
1993-12-18 ltoutenc.dtx v1.3d		
General: Some T1 stuff had drifted into the OT1 file.		102
1993-12-18 ltpage.dtx LaTeX2e		
\sloppy: Added		
\emergencystretch		475
1993-12-19 ltclass.dtx v0.2r		
\endfilecontents: Different message when ignoring a file		566
1993-12-19 ltfntcmd.dtx v3.0b		
General: \pdef command added		286
Added by ASAJ.		294
Made \@newfontswitch produce an error if command already exists, and added \@renewfontswitch, ASAJ		286
Other tidying		286
Some more tidying done		286

Untidying added, so this is now a TEMPORARY version. . .	286	<code>\math@version</code> : New math font setup	163
Wording changes by CAR. . .	294	1994-01-17 <code>ltfssini.dtx</code> v2.1e <code>\not@math@alphabet</code> : Message changed	257
<code>\DeclareOldFontCommand</code> : Corrected and tidied	293	1994-01-17 <code>ltfssstrc.dtx</code> v2.3a General: New math font setup . .	193
<code>\DeclareTextFontCommand</code> : Corrected and tidied	288	<code>\check@mathfonts</code> : New math font setup	202
1993-12-19 <code>ltspace.dtx</code> LaTeX2e <code>\@bsphack</code> : There seem to be problems with selfmade birthday presents	78	<code>\glb@currsz</code> : New math font setup	199
1993-12-20 <code>ltdefns.dtx</code> LaTeX2e <code>\@reargdef</code> : Kept old version of <code>\@reargdef</code> , for <code>array.sty</code> . . .	41	<code>\restglb@settings</code> : New math font setup	202
1993-12-20 <code>ltfiles.dtx</code> v0.9m <code>\@obsoletefile</code> : Added this command, removed <code>@oldfilewarning</code>	100	1994-01-18 <code>ltbibl.dtx</code> LaTeX2e <code>\bibliography</code> : Use <code>\@input@</code> so include files are listed.	471
1994-01-05 <code>fontdef.dtx</code> v2.1d General: Removed <code>nf</code> prefix from file names.	264	1994-01-18 <code>ltclass.dtx</code> v0.2t <code>\@ifclassloaded</code> : Fix typo <code>\@pkgetension</code>	553
1994-01-13 <code>ltmath.dtx</code> v0.9o <code>\@eqnocr</code> : correcting 0.9i	355	1994-01-18 <code>ltfiles.dtx</code> v0.9p <code>\@iffileonpath</code> : Macro added . .	97
General: correcting 0.9i	354	<code>\@input</code> : do not use a different definition for <code>\input@path</code> . .	99
1994-01-14 <code>ltdirchk.dtx</code> v0.2d <code>\IfFileExists</code> : Close the <code>texsys.aux</code> output stream . . .	10	<code>\@input@</code> : Macro added	99
1994-01-15 <code>ltfiles.dtx</code> v0.9o <code>\document</code> : move <code>\@preamblecmds</code> after document hook	92	<code>\IfFileExists@</code> : New Definition <code>\include</code> : Use <code>\@input@</code> so include files are listed.	94
1994-01-17 <code>ltclass.dtx</code> v0.2s <code>\@fileswithoptions</code> : Modify to reduce parameter stack usage	562, 564	<code>\InputIfFileExists</code> : New Definition	98
General: Added many more <code>\@onlypreamble</code> commands . .	552	1994-01-18 <code>ltfssini.dtx</code> v2.1f <code>\not@math@alphabet</code> : Message corrected	257
Wrapped long lines to column 72	552	1994-01-18 <code>ltmiscen.dtx</code> v0.9p <code>\@verbatim</code> : Add <code>\global\@inlabelfalse</code> . . .	341
1994-01-17 <code>ltfiles.dtx</code> LaTeX2e <code>\listfiles</code> : New Version, adds ' <code>.tex</code> ' if needed, and lines up columns	100	Only add <code>\penalty</code> if in <code>hmode</code> .	341
1994-01-17 <code>ltfssbas.dtx</code> v2.1a General: New math font setup . .	154	1994-01-19 <code>fontdef.dtx</code> v2.1e General: Added missing setting for symbols in bold version. . . .	269
<code>\curr@math@size</code> : New math font setup	164	1994-01-19 <code>ltdirchk.dtx</code> v0.2e <code>\IfFileExists</code> : name changed from <code>\test</code>	9
<code>\everydisplay</code> : New math font setup	163	<code>\input@path</code> : No longer check that an empty group is in the path .	11
<code>\everymath</code> : New math font setup	163	<code>\strip@prefix</code> : name changed from <code>\strip@meaning</code> , to match NFSS.	5
<code>\frozen@everydisplay</code> : New math font setup	164	1994-01-19 <code>ltmath.dtx</code> v1.0n classes <code>\mathindent</code> : Deferred setting of <code>\mathindent</code>	356
<code>\frozen@everymath</code> : New math font setup	163	1994-01-20 <code>ltdirchk.dtx</code> v0.2f General: <code>\@copytexsys</code> and the <code>texsys.new</code> file removed	9
		Modify all of <code>ltxcheck</code>	14

<code>\IfFileExists: \copytexsys</code> removed	10	1994-01-31 <code>lftntcmd.dtx v3.1b</code> General: <code>\@normalsize</code> no longer defined	286
1994-01-21 <code>ltclass.dtx v0.2u</code> <code>\documentstyle: compatibility file</code> now <code>latex209.def.</code>	560	1994-02-01 <code>ltpage.dtx LaTeX2e</code> <code>\pagestyle: (DPC)</code> Modify to get nicer error message	473

(DPC) remove <code>\@normalsize</code> check	91	<code>\setcounter</code> : <code>\@nocnterr</code> now has counter name argument	147
1994-03-28 ltfloat.dtx v1.0b		<code>\stepcounter</code> : Use <code>\addtocounter</code> to have name checked	147
<code>\caption</code> : Use <code>\normalsize</code> not <code>\@normalsize</code>	451	1994-04-09 ltthm.dtx v1.0b	
General: Split further from ltherest.dtx	448	<code>\@othm</code> : Use standard counter error message (FMi)	434
1994-03-28 ltlists.dtx v1.0b		1994-04-11 ltclass.dtx v0.3g	
General: Improve documentation	359	<code>\endfilecontents</code> : Add star form, dont write <code>\endinput</code> at the end of the file.	566
1994-03-28 ltmiscen.dtx v1.0c		<code>\ProvidesFile</code> : Protect against weird catcodes.	557
General: Improve Documentation	331	1994-04-11 ltfsbas.dtx v2.1h	
1994-03-28 ltplain.dtx v1.0c		General: Added <code>\defaultscriptratio</code> and <code>\defaultscriptscriptratio</code> . ASAJ.	154
<code>\newlanguage</code> : Remove some <code>\outer</code> declarations.	17		

<code>\defaultscriptratio</code> : Macro added	174	<code>\no@alphabet@error</code> : Use std LaTeX error macro	154
<code>\defaultscriptscriptratio</code> : Macro added	174	1994-04-18 <code>ltfssdcl.dtx</code> ???	
1994-04-12 <code>ltboxes.dtx</code> v1.0c		<code>\DeclareMathAlphabet</code> : Pass correct arg (2 not 3)	231
General: Remove <code>\@acci</code> , now defined in <code>ltplain.dtx</code>	381	1994-04-18 <code>ltfssdcl.dtx</code> v2.1d	
Remove <code>\@dischyph</code> , now defined in <code>ltinit.dtx</code>	381	General: Removed surplus <code>\no@alphabet@error</code> (see <code>fam.dtx</code>)	220
1994-04-12 <code>ltdefns.dtx</code> v1.0g		1994-04-18 <code>ltfstrc.dtx</code> v2.3d	
<code>\@dischyph</code> : Define <code>\@dischyph</code> , was previously in <code>ltboxes.dtx</code>	51	General: Changed to new error/warning scheme	193
1994-04-12 <code>ltplain.dtx</code> v1.0d		<code>\font@submax</code> : Changed dimen to macro	210
General: Define <code>\@acci</code>	29	<code>\fontsubfuzz</code> : Changed dimen to macro	210
1994-04-12 <code>ltvers.dtx</code> v1.0b		<code>\subst@size</code> : <code>\font@submax</code> and <code>\fontsubfuzz</code> now macros	211
General: Have version info generated automatically.	33	1994-04-19 <code>ltpage.dtx</code> v1.0b	
1994-04-14 <code>ltfntcmd.dtx</code> v3.2b		General: Improve documentation	473
General: Macros renamed to non-private forms, JB	286	1994-04-20 <code>ltfntcmd.dtx</code> v3.3a	
<code>\DeclareOldFontCommand</code> : Renamed from <code>\@newfontswitch</code>	293	General: Documentation up-dated	286
1994-04-15 <code>ltboxes.dtx</code> v1.0d		New implementation of <code>\nocorr</code>	286
<code>\@isavebox</code> : Added missing procent character.	378	<code>\check@nocorr@</code> : Macros added	290
1994-04-17 <code>ltcounts.dtx</code> v1.0e		<code>\maybe@ic@</code> : <code>\nocorr</code> etc removed from list of tokens to check, leaving only punctuation characters	291
<code>\@newctr</code> : Use <code>\@nocounterr</code> instead of <code>\@nocnterr</code>	147	1994-04-20 <code>ltmiscen.dtx</code> v1.0e	
<code>\addtocounter</code> : Use <code>\@nocounterr</code> instead of <code>\@nocnterr</code>	147	<code>\enddocument</code> : Changed logic for producing warning messages	333
<code>\setcounter</code> : Use <code>\@nocounterr</code> instead of <code>\@nocnterr</code>	147	1994-04-21 <code>ltboxes.dtx</code> v1.0e	
1994-04-17 <code>lterror.dtx</code> v1.0h		<code>\@iiiminipage</code> : Extra <code>\bgroup</code> for colour	383
<code>\@nocounterr</code> : New name for error message, old error message (without arg) kept	65	<code>\@mpfootnotetext</code> : Extra <code>\endgraf</code> for colour	384
1994-04-17 <code>ltthm.dtx</code> v1.0c		<code>\endminipage</code> : Extra <code>\egroup</code> for colour	383
<code>\@othm</code> : Use new std counter error message (FMi)	434	1994-04-21 <code>ltfinal.dtx</code> v0.1c	
1994-04-18 <code>ltfinal.dtx</code> v0.1b		General: Added comments, set the catcodes of 128–255.	610
General: Initialise <code>\textheight</code> , <code>\textwidth</code> and page style	612	1994-04-22 <code>ltfssini.dtx</code> v2.1g	
1994-04-18 <code>ltfloat.dtx</code> v1.0d		<code>\not@math@alphabet</code> : Message changed again	257
<code>\@footnotetext</code> : (DPC) Remove Colour support	465	1994-04-23 <code>ltfinal.dtx</code> v0.1d	
<code>\@savemarbox</code> : (DPC) Remove Colour support	460	General: Check that <code>\font@submax</code> is still zero	610
1994-04-18 <code>ltfssbas.dtx</code> v2.1i		1994-04-24 <code>ltoutput.dtx</code> v1.0m	
General: Macro <code>\no@alphabet@help</code> removed again	154	<code>\@resetfps</code> : Number 2 changed to <code>\tw@</code>	537
<code>\calculate@math@sizes</code> : Changed message to log only	174	Warning changed	537

\@specialoutput: Message changed to give more info and ‘top’ removed	494	1994-04-28 ltplain.dtx v1.0g General: Turn off overfull box tracing in log	25
\@topnewpage: Message changed to give more info	493	1994-04-29 ltclass.dtx v1.0a General: Change version number to 1 (no other change)	552
Warning message removed as it will be generated later	492	1994-04-29 ltmiscen.dtx v1.0f \@verbatim: \leavevmode added	341
General: Changed \@normalsize to \normalsize.	476	Change to \everypar added	342
Corrected unverbbed commands in documentation.	476	1994-04-29 ltoutenc.dtx 1.4a General: Removed \EncodingSpecific. Renamed all the commands. Added \DeclareTextGlyph and \UndeclareTextCommand.	106
Removed some long lines and other aesthetic changes.	476	Removed Rokicki’s OT1 variant encoding. Moved the driver to the top.	105
Warning messages changed/corrected.	476	1994-04-30 ltfntcmd.dtx v3.3b General: Documentation up-dated and tidied	286
1994-04-24 ltpictur.dtx v0.1b General: Removed surplus spaces after \hbox to in several cases	409	Prefix frag@ changed to frag in \@protecteddef	286
1994-04-25 ltclass.dtx v0.3h General: Removed spurious extra ‘.’s at the end of error messages	552	Title changed	286
1994-04-25 ltfloat.dtx v1.0e \@largefloatcheck: Changed warning message to give more info	457	Warning changed to info message in \@protecteddef	286
Command added	457	1994-04-30 ltoutput.dtx v1.0n \@activechar@info: \@activechar@warning changed to \@activechar@info	502
General: Changed warning messages	448	\@combinedblfloats: Removed rule in topnewpage case	508
Removed obsolete tracing code	448	\@emptycol: Empty column action added: \@emptycol	491
1994-04-27 ltfssstrc.dtx v2.3e General: Corrected item that was forgotten in last change.	193	\@flsetnum: Rogue space removed	537
1994-04-28 lterror.dtx v1.0j \@inmatherr: Macro added	67	\@specialoutput: Cut-off point changed to 2\baselineskip	494
1994-04-28 lterror.dtx v1.1c \@inmatherr: Replaced \noexpand with \protect.	67	Empty column action added: \@emptycol	494
1994-04-28 ltssdcl.dtx v2.1e General: Removed all \uppercase in hex num parsing macros	220	Extra empty column added for twocolumn case	494
1994-04-28 ltlists.dtx v1.0c \item: Replaced \@ltxnomath by \@inmatherr	369	Extra empty column added for twocolumn case (wrong, see below)	494
1994-04-28 ltpictur.dtx v0.1c General: bezier curves added	429	\@topnewpage: Added setting of \@col@number	491
\multiput: (DPC) Ignore spaces between)(.	411	Cut-off point changed to 3\baselineskip	493
(DPC) Macro added	411	Empty column action added: \@emptycol	493
\picture: (DPC) Ignore spaces before (.	410	Message changed for Frank	493

General: <code>\@activechar@warning</code>	Set all the catcodes	610
changed to an info message.	1994-05-02 <code>ltfinal.dtx</code> v0.1f	
Added <code>\col@number</code>	General: Set the catcode of	
Documentation tidied.	control-J.	619
Empty column action added.	1994-05-02 <code>ltmiscen.dtx</code> v1.0g	
Fixed bug from <code>\dblfigrule</code>	General: Changed 91 to 1991 and	
with <code>\@topnewpage</code>	moved some bits	331
Full of floats action improved.	1994-05-02 <code>ltoutput.dtx</code> v1.0o	
<code>\col@number</code> : Added	<code>\@resethfps</code> : Code shortened	537
<code>\col@number</code>	General: Code of <code>\@resethfps</code>	
<code>\onecolumn</code> : Added setting of	shortened.	476
<code>\col@number</code>	1994-05-03 <code>ltbibl.dtx</code> v1.0b	
1994-05-01 <code>lterror.dtx</code> v1.0k	<code>\nocite</code> : Make <code>\nocite</code> issue a	
<code>\@latexerr</code> : (CAR) Added draft	warning for an undefined	
<code>\@latexinfo</code>	citation key.	471
1994-05-01 <code>ltoutenc.dtx</code> 1.4a	1994-05-03 <code>ltfinal.dtx</code> v0.1f	
General: Added the <code>\a</code> command.	General: Set the catcode of	
Added the <code>\SaveAtCatcode</code> and	control-J to be ‘other’, for use	
<code>\RestoreAtCatcode</code>	in messages.	610
commands.	1994-05-03 <code>lfloat.dtx</code> v1.0f	
Removed the <code>uc/lc</code> table	General: (CAR) Added	
settings, since the T1 <code>uc/lc</code>	<code>\@largefloatcheck</code>	448
table is now the default.	Removed unnecessary braces	
Rewrote for the new	from arguments of	
syntax.	<code>\@ifnextchar</code>	448
1994-05-01 <code>ltoutenc.dtx</code> v1.4a	<code>\end@dblfloat</code> :	
General: Removed Rokicki’s	<code>\@largefloatcheck</code> added	456
encoding.	<code>\end@float</code> : (CAR) Added	
Renamed the commands,	<code>\@largefloatcheck</code>	455
removed the	1994-05-03 <code>ltfssdcl.dtx</code> v2.1f	
<code>\EncodingSpecific</code> command.	General: Renamed	
Turned all slots into decimal.	<code>\@@DeclareMathDelimiter</code> to	
Added <code>\a</code>	<code>\@DeclareMathDelimiter</code>	220
1994-05-02 <code>ltcntrl.dtx</code> v1.0l	1994-05-03 <code>ltlists.dtx</code> v1.0d	
<code>\@break@tfor</code> : Macro added (from	<code>\@item</code> : <code>\hskip</code> changed to <code>\kern</code>	370
<code>ltfiles.dtx</code>)	<code>\item</code> : Removed superfluous	
1994-05-02 <code>ltdefns.dtx</code> v1.1f	braces	369
<code>\renewcommand</code> : Removed surplus	1994-05-03 <code>ltmiscen.dtx</code> v1.0h	
<code>\space</code> in error	<code>\@centercr</code> : <code>\@badcrerr</code> replaced	
<code>\renewenvironment</code> : Removed	by <code>\@nolnerr</code>	339
surplus <code>\space</code> in error	1994-05-03 <code>lttab.dtx</code> v1.0d	
1994-05-02 <code>ltfiles.dtx</code> v1.0f	<code>\endpbox</code> : Use <code>\@finalstrut</code>	
<code>\@iffilenamepath</code> : <code>\@break@loop</code>	based on depth of	
renamed to <code>\@break@tfor</code>	<code>\@arstrutbox</code>	408
<code>\@obsoletefile</code> : Make	1994-05-04 <code>ltclass.dtx</code> v1.0b	
<code>\@onlypreamble</code>	<code>\NeedsTeXFormat</code> : Changed	
1994-05-02 <code>ltfinal.dtx</code> v0.1e	wording of the warning	561
General: Added setting the ‘letter’	1994-05-04 <code>lterror.dtx</code> v1.0m	
catcodes.	<code>\@badcrerr</code> : Error message	
Added setting the ‘other’	removed	67
catcodes.	1994-05-05 <code>ltbibl.dtx</code> v1.0c	
Added setting the special	<code>\@citex</code> : Set switch for warning	
catcodes.	and end of run.	470
Made slot 127 illegal		

- `\nocite`: Do not write page number in `\nocite` warning message. 471
- Set switch for warning and end of run. 471
- 1994-05-05 ltfinal.dtx v0.1g
 - General: Added empty errhelp. . . 610
 - `\errhelp`: Set error help empty. . 623
- 1994-05-05 ltfntcmd.dtx v3.3c
 - `\@math@egroup`: Corrected `\@fontswitch` and added saved versions 293
 - General: Corrected `\@fontswitch` 286
- 1994-05-05 ltmiscen.dtx v1.0i
 - General: Removed braces from `ifnextchar` and `ifstar` arguments 331
- 1994-05-07 lttab.dtx v1.0c
 - `\@maxtab`: Changed `\@firsttab` to `\chardef` 391
 - Changed `\@maxtab` to `\chardef` 391
 - General: Removed definition of `\+` 387
 - Removed surplus braces from `\@ifnextchar` constructs . . . 387
- 1994-05-08 ltfntcmd.dtx v3.3d
 - General: Removed `\@undefinedfonterror` 286
 - `\normalsize`: Removed `\@undefinedfonterror` 294
- 1994-05-09 ltfntcmd.dtx v3.3f
 - General: Replaced all `\next` by `\@let@token` and undo change 3.3e, whatever that was. . . . 286
- 1994-05-10 ltdefns.dtx v1.0n
 - General: (ASAJ) Added `\DeclareProtectedCommand`. . . 36
 - Added `\DeclareProtectedCommand` . . 44
 - Removed braces around `\@ifundefined` argument. ASAJ. 41
 - `\makeatother`: Added `\makeatletter` and `\makeatother` ASAJ. 51
- 1994-05-10 lterror.dtx v1.0n
 - `\@latexerr`: (ASAJ) Added extra blank lines to `\@latexerr`. . . . 65
- 1994-05-10 ltmiscen.dtx v1.0j
 - `\@sverb`: Slight change in error message text. 343
- 1994-05-11 ltboxes.dtx v1.0f
 - `\@begin@tempboxa`: Use new `\color@setgroup` concept. . . 376
- `\@iiiminipage`: Use new `\color@setgroup` concept. . . 383
- `\@mpfootnotetext`: Use new `\color@setgroup` concept. . . 384
- Use new `\normalcolor` and `\@finalstrut`. 384
- General: Superfluous braces removed from several commands 375
- `\color@setgroup`: macro added for colour support 377
- `\endminipage`: Use new `\color@setgroup` concept. . . 383
- 1994-05-11 ltclass.dtx v1.0c
 - `\endfilecontents`: Add checks for form feed and tab 566
- 1994-05-11 ltdirchk.dtx v1.0e
 - General: Add `\ProvidesFile` as used in fd files. 4
- 1994-05-11 lterror.dtx v1.0o
 - `\@latexerr`: (ASAJ) Removed one of the extra blank lines to `\@latexerr`. 65
- 1994-05-11 ltlogos.dtx v1.0o
 - `\LaTeX`: Use `\DeclareProtectedCommand`. ASAJ. 87
 - `\LaTeXe`: Use `\DeclareProtectedCommand`. ASAJ. 87
- 1994-05-11 ltoutenc.dtx 1.5a
 - General: Made T1 and OT1 generate packages rather than def files. Renamed the ‘package’ module to ‘teststy’. 105
- 1994-05-11 ltoutenc.dtx v1.5a
 - General: Reimplemented `\DeclareTextCommand` using `\@changed@cmd` and `\DeclareProtectedCommand`. 106
 - Renamed the commands again. Made the encoding part of the command syntax. Added the `\DeclareTextCommand` interface. Used `\DeclareProtectedCommand`. 102
 - `\DeclareTextAccent`: Reimplemented using `\DeclareTextCommand`. 108
- 1994-05-11 ltspc.dtx v1.0o
 - `\,`: Use `\DeclareRobustCommand`. ASAJ. 85
 - `\hspace`: Use `\DeclareRobustCommand`.

- 1994-05-13 ltfiles.dtx v1.0g
 `\document`: Added execution of
 `\every@size` 91
- 1994-05-13 ltfinal.dtx v0.1h
 General: Added package `otlenc`,
 and defined `\@acci`, `\@accii`
 and `\@acciii`. 610
- 1994-05-13 ltfinal.dtx v1.0h
 General: Added output enc stuff . 622
- 1994-05-13 ltfloat.dtx v1.0g
 `\@footnotetext`: (DPC) Add new
 style colour support:
 `\normalcolor` 465
 (DPC) Use `\@finalstrut` 465
 `\@xfloat`: (DPC) Use
 `\normalcolor` 453
- 1994-05-13 ltfntcmd.dtx v3.3g
 General: Replaced `\@protecteddef`
 by `\DeclareRobustCommand` . 286
- 1994-05-13 ltfssbas.dtx v2.1k
 General: Remove File identification
 ‘typeout’ 154
- 1994-05-13 ltfssbas.dtx v2.1l
 `\DeclareFontEncoding`: Init
 encoding change command . 157
 `\define@newfont`: Use `\@input@`
 for fd files 165
- 1994-05-13 ltfssdcl.dtx v2.1h
 General: Removed file
 identification typeout 220
- 1994-05-13 ltfssini.dtx v2.1j
 General: Removed file
 identification typeout 245
- 1994-05-13 ltfsstrc.dtx v2.3g
 General: Removed typeouts as
 `\ProvidesPackage` writes to
 log. 193
- 1994-05-13 ltoutenc.dtx v1.5b
 General: Added `\{`, `\}` and `\$`. .. 102
 Renamed
 `\DeclareProtectedCommand` to
 `\DeclareRobustCommand`. ... 102
 Replaces `\space` by ‘ ’ in
 `\csname`. 102
- 1994-05-13 ltpictur.dtx v0.1d
 General: Removed surplus braces
 from `\if..` constructions .. 409
- 1994-05-13 lttab.dtx v1.0d
 `\@contfield`: Colour support ... 393
 `\@startfield`: Colour support .. 392
 `\@stopfield`: Colour support ... 393
 `\a`: moved to ltoutenc 391
- 1994-05-14 fontdef.dtx v2.1f
 General: Removed .def files. 264
- 1994-05-14 ltfssbas.dtx v2.1m
 `\enc@update`: Macro added 161
- 1994-05-14 ltfssbas.dtx v2.1n
 General: Set defaults for all
 `\f@...` 162
 `\DeclareErrorFont`: Don’t set
 `\f@encoding` 168
 `\DeclareFontEncoding`: Log if
 encoding is redeclared 157
 Only init enc change cmd when
 new encoding 157
- 1994-05-14 ltfssini.dtx v2.1k
 General: Init error font just before
 checking for fontdef.cfg 260
 `\reset@font`: Remove surplus
 braces 258
- 1994-05-14 ltfsstrc.dtx v2.3h
 `\selectfont`: Added
 `\enc@update` 198
- 1994-05-14 ltoutenc.dtx 1.5d
 General: Moved the driver to the
 top. 105
- 1994-05-14 ltoutenc.dtx v1.5c
 General: Added the fontenc
 package 143
 Added the fontenc package. .. 102
 Fixed a bug which caused an
 infinite loop if `\f@encoding`
 was incorrectly set. 102, 106
 Moved fontsmpl to its own dtx
 file. 102
- 1994-05-14 ltoutenc.dtx v1.5d
 General: Rewrote
 `\DeclareTextCommand` to define
 its argument to use the current
 encoding by default, rather
 than the encoding provided to
 `\DeclareTextCommand`. . 102, 106
 Tidied up the documentation. . 102
- 1994-05-14 ltoutenc.dtx v1.5e
 General: Replaced `\ENC@cmd` by
 `\ENC-cmd`. 102
- 1994-05-15 ltfssbas.dtx v2.1o
 General: encoding cmds changed
 to enc-cmd 154
- 1994-05-16 fontdef.dtx v2.1g
 General: Removed
 `\DeclareFontEncoding` for ot1
 and t1 and input .def files
 instead 264
- 1994-05-16 ltalloc.dtx v1.1a
 General: (ASAJ) Split from
 ltinit.dtx. 54

1994-05-16 ltcntrl.dtx v1.0a	1994-05-16 ltoutput.dtx v1.0q
General: (ASAJ) Split from	<code>\@writesetup</code> : Changed setting of
ltinit.dtx. 56	accents (FMi): with the new
1994-05-16 ltdefns.dtx v1.1a	encoding setup they can use
General: (ASAJ) Split from	<code>\let</code> . It could also use the new
ltinit.dtx. 36	internal commands? 504
1994-05-16 lterror.dtx v1.1a	General: Changed setting of
General: (ASAJ) Completely new	accents (FMi). 476
error interface. 60	1994-05-16 ltpar.dtx v1.1a
(ASAJ) Split from ltinit.dtx. . 60	General: (ASAJ) Split from
1994-05-16 ltfinal.dtx v1.0i	ltinit.dtx. 69
General: moved output enc stuff to	1994-05-16 ltplain.dtx v1.0h
lfonts 622	General: Comment out encoding
1994-05-16 ltffsbas.dtx v2.1p	specific commands 29
<code>\fontsize</code> : Pass <code>\baselinestretch</code>	Remove <code>\@acci</code> and friends
not <code>\f@linespread</code> 162	again 29
<code>\linespread</code> : Remove surplus	Remove unnecessary def for
braces 162	<code>\item</code> 28
1994-05-16 ltffsini.dtx v2.1m	<code>\loop</code> : Use Kabelschacht method 27
<code>\@acciii</code> : Define saved versions of	<code>\m@th</code> : Remove unnecessary space 28
accents 261	1994-05-16 ltspc.dtx v1.1a

<code>\ensuremath</code> : Use	removing from list, not before 559
<code>\DeclareRobustCommand</code> and	1994-05-17 ltdefns.dtx 1.1b
add extra braces in math	General: (ASAJ) Added the
mode 355	<code>\@protect@...</code> commands. . . 45
1994-05-16 ltoutenc.dtx 1.5h	1994-05-17 ltdefns.dtx v1.1b
General: <code>\pounds</code> was still using u	General: (ASAJ) Added definitions
rather than ui shape. 118	for protect. 36
1994-05-16 ltoutenc.dtx v1.5f	(ASAJ) Removed warnings and
General: enc files now have uc	logging to lterror.dtx. 36
encoding name parts (FMi) . 102	Added the discussion of
Revert code so that the	protected commands, defined
encoding given is used in	the values that <code>\protect</code>
<code>\DeclareTextCommand</code> (FMi) 102	should have. 44
1994-05-16 ltoutenc.dtx v1.5g	1994-05-17 ltdefns.dtx v1.1c
General: Made fontenc.sty use the	General: (ASAJ) Redid definitions
new mixed-case encoding files. 102	for protect. 36
Removed the lowercasing of the	1994-05-17 lterror.dtx v1.1b
filename. 143	General: (ASAJ) Moved error stuff
1994-05-16 ltoutenc.dtx v1.5h	from ltdefns.dtx. 60
General: Added <code>\NG</code> , <code>\ng</code> , <code>\TH</code> , <code>\th</code> ,	1994-05-17 ltffsini.dtx v2.1n
<code>\DH</code> , <code>\dh</code> , <code>\DJ</code> and <code>\dj</code> 102	<code>\copyright</code> : Really add extra
Added <code>\r</code> (ring accent) and <code>\k</code>	braces 258
(ogonek) accents. 102	<code>\nfss@text</code> : Added braces to allow
Fixed a bug with <code>\pounds</code> 102	use in subscripts 258
Removed <code>\P</code> from the OT1	1994-05-17 ltmath.dtx v1.0i
definitions file. 102	General: Replaced <code>\let</code> by <code>\gdef</code> ,
1994-05-16 ltoutenc.dtx v1.5i	for indirect definition. 351
General: Fixed a bug with <code>\d</code> . . . 102	

- 1994-05-17 ltoutenc.dtx v1.5j
General: Added braces to `\pounds`
so it works as a subscript. . . 102
- 1994-05-18 ltdefns.dtx 1.1c
General: (ASAJ) Renamed the
commands, and removed one
which is no longer needed. . . . 45
- 1994-05-18 ltdefns.dtx v1.1c
General: Redid the discussion and
definitions, in line with the
proposed new setting of
`\protect` in the output
routine. 44
- 1994-05-18 ltfinal.dtx v0.1j
General: Corrected the lcode for
d-bar. 610
- 1994-05-18 ltlogos.dtx v1.1b
General: (ASAJ) Added the $\mathrm{T}_{\mathrm{E}}\mathrm{X}$
logo. 87
(ASAJ) Made the $\mathrm{L}^{\mathrm{T}}\mathrm{E}_{\mathrm{X}}2_{\epsilon}$ logo
use the text font ‘2’ rather
than the math font ‘2’. 87
- 1994-05-18 ltoutenc.dtx v1.5k
General: Made dotted-i produce
‘i’. 102
Removed braces from `\pounds`
and `\dollar`. 102
Replaced `\defaultencoding`
with `\encodingdefault`. . . . 102
- 1994-05-19 ltbibl.dtx v1.1a
General: Initial version of
ltbibl.dtx, split from
ltxbib.dtx 469
- 1994-05-19 ltcounts.dtx v1.1a
General: Extracted file from
ltcntlen. 146
- 1994-05-19 ltdefns.dtx v1.1d
General: (RmS) Added definitions
for `\@namedef` and `\@nameuse`
again. 36
- 1994-05-19 ltfinal.dtx v0.1k
General: Removed `\makeat...` . . 610
- 1994-05-19 ltidxglo.dtx v1.1a
General: Initial version of
ltidxglo.dtx, split from
ltxbib.dtx 467
- 1994-05-19 ltlength.dtx v1.1a
General: Extract file ltlength from
ltcntlen. 153
- 1994-05-19 ltpageno.dtx v1.1a
General: Extract file ltpageno from
ltcntlen. 326
- 1994-05-19 ltplain.dtx v0.1k ltfinal
`\showoutput`: used `\maxdimen` not
99999 30
`\showoverfull`: used `\one` not 1 . 30
- 1994-05-19 ltxref.dtx v1.1a
General: Extract file ltxref from
ltcntlen. 327
- 1994-05-20 ltdefns.dtx v1.1e
General: Changed command name
from `\@checkcommand` to
`\CheckCommand`. 36
`\CheckCommand`: Changed name
from `\@checkcommand` to
`\CheckCommand`. 43
- 1994-05-20 lterror.dtx v1.1c
General: (ASAJ) Added
`\@latex@info@no@line`. . . . 60
(ASAJ) Added missing full
stops. 60
(ASAJ) Fixed a bug with
`\@inmatherr`. 60
- 1994-05-20 ltfinal.dtx v0.1l
General: Use new font warning
commands 616
- 1994-05-20 ltfloat.dtx v1.0h
`\@endfloatbox`: Restore outer
value of `@nobreak` switch. . . 457
`\outer@nobreak`: Macro added:
default is to do nothing. . . . 457
- 1994-05-20 ltfntcmd.dtx v3.3h
General: Use new error commands 286
- 1994-05-20 ltfsbas.dtx v2.1q
General: Use new error commands 154
- 1994-05-20 ltfsstrc.dtx v2.3i
General: Use new error command
names 193
- 1994-05-20 ltmiscen.dtx v1.0l
`\@writefile`: Added correct
setting of `\protect`. 335
- 1994-05-20 ltmiscen.dtx v1.0m
General: Use new warning
commands 331
- 1994-05-20 ltoutput.dtx v1.0s
`\@writesetup`: Added setting of
`\protect` during `\shipout`. . . 503
General: Added setting of
`\protect` during `\shipout`. . . 476
- 1994-05-20 ltpage.dtx v1.0d
`\markright`: Changed setting for
`\protect`. 474
- 1994-05-20 ltsect.dtx v1.0c
General: Correct setting of
`\protect`. 445

<code>\addcontentsline</code> : Correct setting of <code>\protect</code>	445	(DPC) New version using long command name.	60
1994-05-21 <code>ltbibl.dtx</code> v1.1b		1994-05-22 <code>ltfloat.dtx</code> v1.0i	
General: Use new warning commands	469	General: Use new warning commands	448
1994-05-21 <code>lterror.dtx</code> v1.1d		1994-05-22 <code>ltoutput.dtx</code> v1.0t

1994-05-21 <code>ltxref.dtx</code> v1.1b		1994-05-23 <code>ltoutput.dtx</code> v1.0u	
General: Use new warning commands	327	<code>\@activechar@info</code> : Added <code>\MessageBreak</code>	502
<code>\newlabel</code> : Use new warning commands	329	<code>\@writsetup</code> : Changed resetting of <code>\protect</code> after shipout to use <code>\aftergroup</code>	503
1994-05-22 <code>ltclass.dtx</code> v1.0f		General: Added <code>\MessageBreak</code> . .	476
General: Use new warning and error commands	548	Changed resetting of <code>\protect</code> after shipout.	476
1994-05-22 <code>ltdefns.dtx</code> v1.1f		1994-05-24 <code>lterror.dtx</code> v1.2e	
General: Use new warning and error cmds	36	<code>\@latex@info@no@oline</code> : Macro added	63
1994-05-22 <code>lterror.dtx</code> v1.1e		1994-05-24 <code>lterror.dtx</code> v1.2f	
General: (ASAJ) Replaced <code>bgroup</code> by <code>begingroup</code> in error messages, to stop extra <code>mathords</code> creeping into <code>math</code> mode.	60	General: (DPC) wrap long lines .	60
1994-05-22 <code>lterror.dtx</code> v1.2a		1994-05-24 <code>lftntcmd.dtx</code> v3.3i	
General: (ASAJ) Made <code>\GenericError</code> , <code>\GenericWarning</code> and <code>\GenericInfo</code> robust.	60	General: Tidying and typos fixed	286
(ASAJ) Replaced <code>\@generic@message</code> and <code>\@generic@error</code> by <code>\GenericError</code> , <code>\GenericWarning</code> and <code>\GenericInfo</code>	60	1994-05-24 <code>ltmiscen.dtx</code> v1.0q	
(ASAJ) Replaced <code>\</code> and tilde by <code>\MessageBreak</code> and <code>\space</code> . .	60	<code>\@currenvline</code> : Use <code>\@empty</code> as outer default	338
(ASAJ) Replaces <code>\string</code> by <code>\protect</code> in some messages. .	60	1994-05-25 <code>ltdirchk.dtx</code> v1.0g	
1994-05-22 <code>lterror.dtx</code> v1.2d		<code>\filename@parse</code> : Mac parser had " typo for :	12
<code>\GenericError</code> : (DPC) Alternative version added for old TeXs . .	60	1994-05-25 <code>lftntcmd.dtx</code> v3.3j	
		General: Insertion of <code>\aftergroups</code> to implement <code>\nocorr</code> moved to the end of the group	286
		<code>\check@icr</code> : Macros added	290
		<code>\check@nocorr@</code> : Insertion of <code>\aftergroups</code> moved and defaults set up for efficiency .	290
		<code>\DeclareTextFontCommand</code> : <code>\expandafter</code> inserted	288

Insertion of <code>\aftergroups</code> moved	288	1994-06-09 <code>ltfinal.dtx</code> v1.0n General: For \TeX 2, do not set codes for higher half of character table.	614, 620
1994-05-25 <code>ltoutput.dtx</code> v1.0v General: Extra documentation. . .	476	1994-06-09 <code>ltfntcmd.dtx</code> v3.3k General: Tidying and typos fixed in documentation	286
1994-05-25 <code>ltsect.dtx</code> v1.0e <code>\@dottedtocline</code> : Put braces around argument 4 (the actual toc entry) to avoid font (and possibly other) changes leaking out to the leaders.	446	1994-06-18 <code>ltfntcmd.dtx</code> v3.3l General: Added check for empty text	286
1994-05-25 <code>ltthm.dtx</code> v1.0c General: Modify documentation .	432	<code>\check@nocorr@</code> : Added check for empty text	290
1994-05-25 <code>ltvers.dtx</code> v1.0d General: Remove PRELIMINARY TEST RELEASE from startup banner (spring is here)	33	1994-06-22 <code>ltfntcmd.dtx</code> v3.3m General: Removed space from <code>\nfss@text</code>	286
1994-05-25 <code>ltxref.dtx</code> v1.1c General: Modify documentation .	327	Renamed <code>\check@nocorr</code>	286
1994-05-26 <code>ltfiles.dtx</code> LaTeX2e <code>\@missingfileerror</code> : Modify message format	99	<code>\check@nocorr@</code> : Renamed <code>\check@nocorr</code> to <code>\text@command</code> to improve <code>\long</code> error message	290
1994-05-26 <code>ltlogos.dtx</code> v1.1c General: Remove <code>\SLiTeX</code> logo . .	87	<code>\DeclareTextFontCommand</code> : Removed space from <code>\nfss@text</code>	288
1994-05-26 <code>ltmiscen.dtx</code> v1.0r General: <code>\literal</code> removed	345	1994-06-22 <code>ltmath.dtx</code> v1.2t classes <code>\mathindent</code> : Set <code>\mathindent</code> at the end of the class instead of at begin document	356
1994-05-26 <code>ltplain.dtx</code> v1.1m <code>\iterate</code> : (CAR) added <code>\long</code> . .	27	1994-07-20 <code>ltlogos.dtx</code> v1.1e <code>\LaTeX</code> : Save a few tokens	87
<code>\underbar</code> : (CAR/FMi) changed to use box <code>\tw@</code>	28	<code>\LaTeXe</code> : Save a few tokens	87
1994-05-26 <code>ltplain.dtx</code> v1.1p <code>\underbar</code> : (DPC) changed to use <code>\sbox</code>	28	1994-07-20 <code>ltpage.dtx</code> v1.0h <code>\sloppy</code> : Save a few tokens	475
1994-05-29 <code>ltfssdcl.dtx</code> v2.1j General: Use new error commands	220	1994-09-16 <code>ltfssbas.dtx</code> v2.1s <code>\nfss@catcodes</code> : Reset [and] as well, just in case	166
1994-05-31 <code>ltfinal.dtx</code> v1.0n General: Renamed <code>lthyphen.*</code> to <code>lthyphen.*</code>	610	1994-10-07 <code>ltoutenc.dtx</code> v1.5l General: Moved the ogonek accent.	102
1994-06-01 <code>ltboxes.dtx</code> v1.0i <code>\@frameb@x</code> : Macro added.	380	1994-10-11 <code>ltdirchk.dtx</code> v1.0h <code>\@TeXversion</code> : Check for \TeX 3.14	13
<code>\@ifframebox</code> : New version, so <code>\width</code> is correct in <code>\framebox</code>	380	General: Modify all of <code>ltxcheck</code> again	14
<code>\fbox</code> : New version, using <code>\@frameb@x</code>	379	1994-10-12 <code>ltsect.dtx</code> v1.0f General: Doc. typos	436
<code>\framebox</code> : New version, so <code>\width</code> is correct in <code>\framebox</code>	379	1994-10-14 <code>fontdef.dtx</code> v2.2a General: New coding	262
1994-06-01 <code>ltlogos.dtx</code> v1.1d <code>\LaTeX</code> : Add <code>\m@th</code> to force math size calculations	87	1994-10-14 <code>ltfssini.dtx</code> v2.2a General: New coding for <code>cfg</code> files .	245
1994-06-01 <code>ltoutput.dtx</code> v1.0w General: Tidied up typesetting. .	476	1994-10-14 <code>ltmiscen.dtx</code> v1.0s General: Move math to other file	331
1994-06-08 <code>ltfinal.dtx</code> v1.0m General: Add patch file system . .	622	1994-10-14 <code>ltplain.dtx</code> v1.1a General: Moved code to other files.	15

1994-10-15 ltfsbas.dtx v2.1t	1994-10-24 ltboxes.dtx v1.0k
<code>\extract@alph@from@version:</code>	<code>\fbox:</code> Inner braces added (to fix
Warn if math alpha is used	latex/1061) 379
outside math 173	1994-10-25 fontdef.dtx v2.2c
1994-10-18 ltboxes.dtx v1.0j	General: Added OMSenc.def . . . 264
<code>\@frameb@x:</code> <code>\leavevmode</code> added . 380	1994-10-25 ltboxes.dtx v1.0l
<code>\@ifframebox:</code> <code>\leavevmode</code> moved	<code>\@isavepicbox:</code> missing percent
to <code>\@frameb@x</code> 380	(moved from ltpatch) 378
<code>\@parboxto:</code> Macro added to	1994-10-25 ltdefs.dtx v1.2b
remove misuse of <code>\@empty</code> . . 381	General: Documentation
General: stuff from ltpatch done . 375	improvements 36
<code>\fbox:</code> <code>\long</code> added 379	1994-10-25 ltoutenc.dtx 1.6a
<code>\mbox:</code> <code>\long</code> added 376	General: Added <code>\textdollar</code> ,
<code>\sbox:</code> <code>\long</code> added 378	<code>\textlbrace</code> , <code>\textrbrace</code> ,
1994-10-18 ltclass.dtx v1.0j	<code>\textsterling</code> ,
General: Move <code>\listfiles</code> to	<code>\textunderline</code> 120
ltfiles.dtx 548	Removed <code>\textlbrace</code> ,
1994-10-18 ltdefs.dtx v1.2a	<code>\textrbrace</code> , <code>\textunderline</code>
<code>\@star@or@long:</code> macro added . . 38	to give them their proper
General: Add extra test for	names. 120
<code>\endgraf</code> 36	1994-10-25 ltoutenc.dtx v1.6a
Add star-forms for all commands 36	General: Added
<code>\renew@environment:</code> reset end	<code>\ProvideTextCommand</code> ,
command 42	<code>\UseTextSymbol</code> ,
1994-10-18 ltfiles.dtx v1.0i	<code>\UseTextAccent</code> ,
<code>\listfiles:</code> code moved here from	<code>\DeclareTextSymbolDefault</code> ,
ltclass 100	<code>\DeclareTextAccentDefault</code> ,
1994-10-18 ltoutenc.dtx v1.5l	<code>\DeclareTextCommandDefault</code> ,
General: Added new definitions of	and <code>\ProvideTextCommandDe-</code>
<code>\patterns</code> and <code>\hyphenation</code> . 113	fault. 102
1994-10-18 ltoutenc.dtx v1.5m	Added the <code>\Provide</code> commands,
General: Added new definitions of	and the default definitions. . 106
<code>\patterns</code> and <code>\hyphenation</code> . 102	Added the defaults. 114
1994-10-18 ltsect.dtx v1.0g	Added the files OTlenc.def,
<code>\@dottedtocline:</code> Added	Tlenc.def and OMSenc.def. . 114
<code>\normalcolor</code> for page	Added the OMS encoding. . . . 125
number 446	1994-10-27 ltoutenc.dtx 1.6b
General: Added <code>\normalcolor</code> . . 436	General: Added <code>\textasciicircum</code>
1994-10-19 ltfsbas.dtx v2.1t	<code>\textasciitilde</code>
<code>\DeclareFontEncoding:</code> Add	<code>\textbackslash</code> <code>\textbar</code>
missing <code>\relax</code> 156	<code>\textbraceleft</code>
1994-10-23 ltfsstrc.dtx v23.k	<code>\textbraceright</code>
<code>\every@math@size:</code> Renamed to	<code>\textcompwordmark</code>
<code>\every@math@size</code> 200	<code>\textemdash</code> <code>\textendash</code>
1994-10-23 ltmath.dtx v1.0l	<code>\textexclamdown</code>
<code>\@eqnnum:</code> Added <code>\normalcolor</code>	<code>\textgreater</code>
since <code>\eqno</code> introduces a	<code>\textthyphenchar</code> <code>\textthyphen</code>
subgroup of the displayed math	<code>\textless</code> <code>\textquestiondown</code>
group 353	<code>\textquotedblleft</code>
<code>\ensuremath:</code> Remove extra	<code>\textquotedblright</code>
braces: but see p 168 of	<code>\textquotedbl</code>
Leslie's book 355	<code>\textquoteleft</code>
	<code>\textquoteright</code>

<code>\textunderscore</code>	1994-10-30 ltdefs.dtx v1.2f
<code>\textvisiblespace</code> 120	General: (DPC)\newwrite's moved to ltfiles 36
Added: <code>\textemdash</code>	1994-10-30 ltmath.dtx v1.0n
<code>\textendash</code> <code>\textexclamdown</code>	General: ASAJ: Moved the new commands to ltoutenc. 351
<code>\textthyphenchar</code> <code>\textthyphen</code>	1994-10-30 ltoutenc.dtx v1.6d
<code>\textquestiondown</code>	General: Added <code>\DeclareTextCom-</code>
<code>\textquotedblleft</code>	<code>positeCommand</code> 102
<code>\textquotedblright</code>	Added <code>\textcircled</code> . 102, 115, 125
<code>\textquoteright</code> 118	Added <code>\t</code> 115
1994-10-27 ltoutenc.dtx v1.5d	Added math commands. 102
General: Rewrote	Added OML encoding. . . 102, 115
<code>\DeclareTextSymbol</code> to define	Added the OML encoding. . . 126
its argument to use the current	Made <code>\textless</code> and
encoding by default, to fit with	<code>\textgreater</code> come from
<code>\DeclareTextCommand</code> 106	OML. 115
1994-10-27 ltoutenc.dtx v1.6b	Moved math commands here
General: Added <code>\textbackslash</code> . 125	from ltmath. 118
Added more defaults for OT1. 114	Removed <code>\textregistered</code> . . . 115
Removed the enc.def files 102	Rewrote <code>\copyright</code> to use
Removed the files OT1enc.def,	<code>\textcircled</code> 115
T1enc.def and OMSenc.def. . . 114	1994-10-31 fontdef.dtx v2.2d
Renamed <code>\textlbrace</code> to	General: Added OMLenc.def 264
<code>\textbraceleft</code> and	1994-10-31 fontdef.dtx v2.2e
<code>\textrbrace</code> to	General: ... and moved further
<code>\textbraceright</code> 125	down 264
1994-10-29 ltmath.dtx 1.0m	1994-10-31 lfloat.dtx v1.1a
General: ASAJ: Added	<code>\@dblfloat</code> : Major changes since
<code>\DeclareMathOperator</code> 346	two-column and one-column
ASAJ: Tidied up	cases merged 452
documentation. 352	<code>\@dblfloatset</code> : Macro added 451
1994-10-29 ltmath.dtx v1.0m	Major changes to parameter
General: ASAJ: Added	parsing, setting of local
<code>\mathellipsis</code> , <code>\mathdollar</code>	variables, etc; two-column and
and <code>\mathsterling</code> 351	one-column cases merged;
ASAJ: Removed <code>\dag</code> , <code>\ddag</code> . . 351	space hacks moved 451
ASAJ: Renamed <code>\S</code> and <code>\P</code> to	<code>\@endfloatbox</code> : (DPC/CAR)
<code>\mathsection</code> and	Extra box added to remove
<code>\mathparagraph</code> and made	colour resetting from vmode . 457
them <code>\mathchardefs</code> 351	<code>\@floatboxreset</code> : Macro added . 455
1994-10-29 ltoutenc.dtx v1.6c	<code>\@footnotetext</code> : (DPC/CAR)
General: Added commands like	Move colour setting to output
<code>\dots</code> for use in text and	routine 465
math. 114	<code>\@savemarbox</code> : (DPC/CAR) Extra
Renamed <code>\P</code> , <code>\S</code> , <code>\dag</code> and	box added for colour 460
<code>\ddag</code> to <code>\textparagraph</code> ,	<code>\@setfps</code> : Macro added 452
<code>\textsection</code> , <code>\textdagger</code>	<code>\@xdblfloat</code> : Macros removed:
and <code>\textdaggerdbl</code> 102	<code>\@dblft</code> , <code>\@xdblfloat</code> 457
1994-10-30 ltdefs.dtx v1.2c	<code>\@xfloat</code> : (DPC/CAR) Extra box
<code>\@onelevel@sanitize</code> : Macro	added to remove colour
added 51	resetting from vmode 453
General:	Major changes, removing setting
(CAR)\@onelevel@sanitize	of local variables, space hacks
added 36	

etc; two-column and one-column cases merged . . .	452	1994-11-04 ltfloat.dtx v1.1b \@footnotetext: (ASAJ) Added	
Reset hook added	453	\protected@edef.	465
\@xympar: (DPC/CAR) Extra box added since needed for floats	461	\footnotemark: Added \protected@xdef to \footnotemark.	466
\fps@dbl: Macro added	452	1994-11-04 ltidxglo.dtx v1.1b \@wrglossary: Added \protected@write to \@wrglossary.	468
1994-10-31 ltoutput.dtx v1.1a \@makecol: (DPC/CAR) Colour resetting moved to here	499	\@wrindex: Added \protected@write to \@wrindex.	468
\@topnewpage: (DPC/CAR) Extra box added to remove colour resetting from vmode	491	General: Removed \if@files from \makeindex.	467
(DPC/CAR) Use \color@begingroup for colour	491	\makeglossary: Removed \if@files from \makeglossary.	468
(DPC/CAR) Use \normalcolor	491	1994-11-04 ltmiscen.dtx v1.0t \@writefile: Removed setting of \protect. ASAJ.	335
1994-11-02 ltoutenc.dtx v1.6d General: Wrapped lines longer than 70 characters.	102	1994-11-04 ltoutenc.dtx v1.6f General: Added _.	116
1994-11-03 ltclass.dtx v1.0k General: Move \@missingfileerror to ltfiles	552	Added \mathunderscore.	118
1994-11-03 ltdirchk.dtx v1.0i General: Generate an error if latex.ltx not used with clean initex	1	1994-11-04 ltpage.dtx v1.0e \markright: Added \@unexpandable@protect. ASAJ.	474
1994-11-03 ltfiles.dtx v1.0j \@missingfileerror: Move here from ltclass	99	1994-11-04 ltsect.dtx 1.0h \@sect: (ASAJ) Added \protected@edef.	440
1994-11-04 ltboxes.dtx v1.0m \@mpfootnotetext: Added \protected@edef. ASAJ. . .	384	General: (ASAJ) Added \protected@xdef to \thanks. . .	436
1994-11-04 ltdefs.dtx v1.2e General: Added \set@display@protect to \typeout. ASAJ.	36	1994-11-04 ltsect.dtx v1.0h General: Added \protected@write to \addtocontents. ASAJ. . .	445
Added commands for setting and restoring \protect. ASAJ. .	46	\addcontentsline: Added \protected@write to \addcontentsline. ASAJ. . .	445
Rewrote protected short commands using \x@protect. ASAJ.	45	1994-11-04 lttab.dtx v1.0h \@mkpream: (ASAJ) Added \@unexpandable@protect to \@mkpream.	405
1994-11-04 lterror.dtx v1.2g General: Added \set@display@protect to \Generic* commands. ASAJ. .	60	\multicolumn: (ASAJ) added \set@typeset@protect. . . .	401
1994-11-04 ltfiles.dtx v1.0k \@nofiles: Added setting of \protected@write, \makeindex and \makeglossary to \nofiles. ASAJ.	93	1994-11-04 ltxref.dtx v1.1d \label: (ASAJ)Added \protected@edef	329
\protected@write: Macro added ASAJ.	94	(ASAJ)Added \protected@write	329
		1994-11-05 ltboxes.dtx v1.0n \@mpfootnotetext: Colour resetting for footnotes moved	

to endminipage: as for main page.	384	1994-11-06 ltssini.dtx v2.2b	
<code>\color@endbox</code> : macro added for colour support	377	<code>\@setsize</code> : Use	
<code>\color@hbox</code> : macro added for colour support	377	<code>\@typeset@protect</code>	258
<code>\endminipage</code> : Colour resetting for footnotes moved to here: as for main page.	383	1994-11-06 ltssstrc.dtx v2.3k	
1994-11-05 ltboxes.dtx v1.0o		<code>\glb@currsiz</code> : New implementation	199
<code>\@mpfootnotetext</code> : Colour groups restored here.	384	<code>\try@simples</code> : New implementation	210
1994-11-05 ltfloat.dtx v1.1c		<code>\try@size@substitution</code> : New implementation	210
<code>\@dblflset</code> : Add compatibility with old version of <code>\@xfloat</code>	451	<code>\tryis@simple</code> : New implementation	210
<code>\@endfloatbox</code> : Use new <code>\color@hbox</code> concept.	457	1994-11-07 fontdef.dtx v2.2f	
<code>\@footnotetext</code> : Removed <code>\normalcolor</code> (again)	465	General: (DPC) Add	
<code>\@savemarbox</code> : Use new <code>\color@hbox</code> concept.	460	<code>\DeclareMathSizes</code> declarations	269
<code>\@setfps</code> : Add compatibility with old version of <code>\@xfloat</code>	452	(DPC) Updated to use	
<code>\@xfloat</code> : Add compatibility with old version of <code>\@xfloat</code> : but the arguments, provided at exorbitant cost, are now completely ignored	452	<code>\ProvidesFile</code>	264
Use new <code>\color@hbox</code> concept.	453	1994-11-07 ltfiles.dtx v1.0l	
<code>\@xympar</code> : Use new <code>\color@hbox</code> concept.	461	<code>\@unused</code> : move here from ltdefns, remove duplicate <code>\@mainaux</code>	90
1994-11-05 ltoutenc.dtx v1.6g		1994-11-07 ltfiles.dtx v1.0m	
General: Added setting of <code>\@typeset@protect</code> to <code>\patterns</code> and <code>\hyphenation</code>	113	<code>\document</code> : Renamed <code>\every@size</code> to <code>\every@math@size</code>	91
1994-11-05 ltoutput.dtx v1.1b		1994-11-07 preload.dtx v2.1e	
<code>\@topnewpage</code> : Use new <code>\color@hbox</code> concept.	491	General: (DPC) Updated to use	
<code>\@writsetup</code> : Change protect settings for new-style, protect-free aux-files.	503	<code>\ProvidesFile</code>	282
Use new <code>\color@hbox</code> concept.	503	1994-11-09 ltboxes.dtx v1.0p	
1994-11-05 ltoutput.dtx v1.1c		<code>\@finalstrut</code> : Revert	
<code>\@beginDvi</code> : Added macro	507	<code>\finalstrut</code> to 2.09 equivalent (from ltpatch)	386
<code>\@beginDvibox</code> : Added macro	488	General: more colour changes.	375
<code>\@writsetup</code> : Add new <code>\AtBeginDvi</code> concept	503	1994-11-09 ltssbas.dtx v2.1v	
<code>\AtBeginDvi</code> : Added macro	488	<code>\@vpt</code> : (DPC) macros added, from <code>setsize.dtx</code>	176
1994-11-06 ltssbas.dtx v2.1u		(DPC) reduce save stack usage latex/1742	176
<code>\cf@encoding</code> : New macro	162	1994-11-10 ltbibl.dtx v1.1c	
<code>\DeclareFixedFont</code> : Renamed <code>\every@size</code> to <code>\every@math@size</code>	155	General: Fix <code>\nocite{*}</code>	469
		<code>\nocite</code> : Fix <code>\nocite{*}</code>	471
		1994-11-10 ltmath.dtx v1.2v classes	
		<code>eqnarray</code> : Added value of <code>\parskip</code> to <code>\abovedisplayskip</code> to compensate for negative <code>\topsep</code>	357
		1994-11-10 ltoutput.dtx v1.1e	
		<code>\@writsetup</code> : Modify <code>\protect</code> setting	503
		1994-11-10 ltplain.dtx v1.1b	
		General: (CAR) added patch to <code>\loop</code>	15
		<code>\iterate</code> : (CAR) added extra <code>\relax</code>	27

- `\smash`: (DPC) colour support . . 349
- (DPC) use `\expandafter`
- instead of `\next` 349
- 1994-11-21 `ltfloat.dtx` v1.1f
- `\endfloatbox`: Added reset of
- minipage flag 457
- Corrected position of
- `\outer@nobreak` 457
- `\@marginparreset`: Macro added 460
- `\@savemarbox`: Added
- `\@setminipage` etc 460
- Added resetting of size and font 460
- Changed to `\color@vbox` 460
- Use `\@setnobreak` etc 460
- `\@setminipage`: Macro added . . . 455
- `\@setnobreak`: Macro added 455
- `\@xfloat`: Added `\@setminipage` 453
- Added resetting of size and font 453
- Changed to `\color@vbox` so
- that large floats overflow at the
- bottom 453
- Missing percents reinserted after
- 4, 8: these are not numbers. 452
- Use `\@setnobreak` 453
- `\@xympar`: Changed to
- `\color@vbox` 461
- 1994-11-21 `ltoutput.dtx` v1.1i
- `\@addtocurcol`: Added
- `\if@nobreak` test before float
- box 516, 520
- `\@specialoutput`: Added
- `\if@nobreak` test 496
- `\@topnewpage`: Changed to
- `\color@vbox` 491
- 1994-11-22 `ltfssdcl.dtx` v2.1o
- General: wrap long lines 220
- 1994-11-22 `ltoutenc.dtx` v1.6i
- General: Corrected `\dots` so that
- there's no kerning in
- monowidth fonts. 102
- Corrected typo with
- `\mathunderscore`. 102
- Fixed empty accents. Again. . 102
- 1994-11-24 `ltdefns.dtx` v1.2h
- `\@newenv`: Added test for `\endgraf` 42
- 1994-11-25 `ltplain.dtx` v1.1f
- General: (DPC) Comment out lots
- of obsolete code 15
- 1994-11-26 `ltfloat.dtx` v1.1b
- `\footnote`: (ASAJ) Added
- `\protected@xdef`. 465
- 1994-11-28 `ltntrl.dtx` v1.0c
- General: Documentation
- improvements 56
- 1994-11-30 `ltfiles.dtx` v1.0o
- `\@dofilelist`: Macro added 101
- `\listfiles`: Use `\@dofilelist` . 100
- `\nofiles`: There is no
- `\@gobblethree`... 93
- 1994-11-30 `ltfssbas.dtx` v2.1y
- `\fontshape`: Use `\@currentcmd` in
- `\@enc@update`. ASAJ. 161
- 1994-11-30 `ltmath.dtx` 1.0q
- General: ASAJ:
- `\DeclareMathOperator` moved
- to AMS \LaTeX 346
- 1994-11-30 `ltmiscen.dtx` v1.0w
- `\enddocument`: (DPC) Do
- warnings even for `\nofiles` . 333
- (DPC) Use `\@dofilelist` 333
- 1994-11-30 `ltoutenc.dtx` 1.7a
- General: Redefined `\a` for the new
- scheme. 114
- 1994-11-30 `ltoutenc.dtx` v1.6g
- General: Removed new definitions
- of `\patterns` and
- `\hyphenation`, since
- encoding-specific commands
- now expand in the mouth. . . 113
- 1994-11-30 `ltoutenc.dtx` v1.7a
- General: Added new code for
- encoding-specific commands.
- These now expand in the
- mouth, which means that
- ligaturing and kerning can
- happen. 102
- Always load the `enc.def` file, so
- that the default encoding for
- the commands will change. . 143
- Redefined `\@changed@cmd` to
- expand in the mouth. 106
- Removed `\@changed@x@mouth`
- since `\@changed@x` now
- expands in the mouth. 106
- Rewrote `\@text@composite` so it
- allows an empty argument, or
- an argument containing lots of
- commands. 108
- 1994-12-01 `ltfinal.dtx` v1.0p
- General: Renamed `lthyphen.*` to
- `hyphen.*`. 610
- 1994-12-01 `lthyphen.dtx` v1.0g
- General: Rename `lthyphen.ltx/cfg`
- to `hyphen.ltx/cfg` 581
- 1994-12-01 `ltplain.dtx` v1.1g
- General: (DPC) More doc changes 15

1994-12-02 fontdef.dtx v2.2i	1994-12-10 ltfntcmd.dtx v3.3q
General: Commented out <code>\ldots</code> .	<code>@@math@egroup</code> : Don't read

General: (DPC) Fix	<code>\mathgroup</code> : (FMi) But a need to
<code>\ProvidesFile</code> usage 193	define <code>\new@mathgroup</code> 154

1995-06-05 fontdef.dtx v2.2k		1995-06-19 ltbibl.dtx v1.1h	
General: Moved math commands		<code>\biblecite</code> : Call <code>\@newl@bel</code> so	
from ltoutenc.dtx.	280	repeated keys produce better	
1995-06-05 ltfinal.dtx v1.0r		warning.	470
General: Added <code>\MakeUppercase</code>		1995-06-19 ltclass.dtx v1.0q	
and <code>\MakeLowercase</code>	610	<code>\documentclass</code> : Dont redefine	
1995-06-05 ltoutenc.dtx v1.7k		<code>\usepackage</code> in compat mode	
<code>\@inmathwarn</code> : Removed		for /1634	560
<code>\protected@cmd</code> and replaced		1995-06-19 ltxref.dtx v1.1e	
with explicit <code>\noexpand</code>	106	<code>\newlabel</code> : Use <code>\@newl@bel</code> to	
General: Allowed		share code with <code>\biblecite</code> . .	329
<code>\ProvideTextCommandDefault</code>		1995-06-28 ltfssini.dtx v3.0b	
after the preamble.	108	General: (DPC) Fix	
Commented out <code>\textless</code> and		documentation typos	245
<code>\textgreater</code>	115	1995-06-28 ltmath.dtx v1.0t	
Moved math commands to		General: minor doc edits	346
fontdef.dtx.	118	1995-07-02 ltplain.dtx v1.1n	
Save some tokens in		General: Removed surplus ‘by’ and	
<code>\textvisiblespace</code> and		‘=’ in various places	15
<code>\textunderscore</code>	115	<code>\offinterlineskip</code> : Replaced	
1995-06-06 ltfinal.dtx v1.0s		1000 by <code>\@m</code>	27
General: Made <code>\MakeUppercase</code>		<code>\showoutput</code> : Use <code>\showoverfull</code>	
and <code>\MakeLowercase</code> brace		to save space	30
their argument.	610	<code>\tracingall</code> : Use <code>\showoutput</code> to	
1995-06-09 ltoutenc.dtx v1.7l		save space	30
<code>\DeclareTextComposite</code> : Rewrote		1995-07-03 ltdefs.dtx v1.2o	
<code>\DeclareTextComposite</code> to		<code>\set@typeset@protect</code> : Use	
define the composite as a		<code>\@typeset@protect</code> for init . .	46
no-argument command rather		1995-07-03 ltfntcmd.dtx v3.3s	
than a two-argument		<code>\t@st@ic</code> : Use clean interface for	
command.	109	jump	292
1995-06-11 ltspc.dtx v1.2g		1995-07-05 ltfntcmd.dtx v3.3s	
<code>\restorecr</code> : (CAR) <code>\relax</code> added		<code>\t@st@ic</code> : Renamed from	
to stop silent eating of *. . . .	86	<code>\test@next</code>	291
1995-06-13 ltfinal.dtx v1.0t		1995-07-05 ltspc.dtx v1.2h	
General: Add patch level string		<code>\@gnewline</code> : Use <code>\break</code>	76
more carefully	622	<code>\@no@pgbk</code> : Macro replaces <code>\@pgbk</code>	
Call <code>\errorstopmode</code>	624	and <code>\nopgbk</code>	75
1995-06-13 ltpictur.dtx v1.1b		<code>\nopagebreak</code> : Reimplemented	
General: Use <code>\ProvidesFile</code> in		both using <code>\@no@pgbk</code>	74
autoload	409	1995-07-09 ltcntrl.dtx v1.0f	
1995-06-14 lttab.dtx v1.1b		<code>\@iforloop</code> : Reimplemented using	
General: Use <code>\ProvidesFile</code> in		Kabelschacht method	59
autoload	387	<code>\@iwhiledim</code> : Reimplemented	
1995-06-15 ltfssbas.dtx v3.0c		using Kabelschacht method . .	57
General: (DPC) minor		<code>\@iwhilenum</code> : Reimplemented	
documentation changes	154	using Kabelschacht method . .	57
1995-06-15 ltfsscnp.dtx v3.0b		<code>\@iwhilesw</code> : Reimplemented using	
General: (DPC) minor		Kabelschacht method	57
documentation edits	216	<code>\@tfor</code> : Reimplemented using	
1995-06-15 ltfssdcl.dtx v3.0b		Kabelschacht method	59
General: (DPC) minor		1995-07-09 ltlists.dtx v1.0j	
documentation changes	220	<code>enumerate</code> : Use <code>\expandafter</code> . .	373
		<code>itemize</code> : Use <code>\expandafter</code> . . .	373

1995-07-12 ltpictur.dtx v1.1d	1995-08-16 ltcentrl.dtx v1.0g

		code	193

1995-10-22 ltfsbas.dtx v3.0j		<code>\end@dblfloat</code> : (CAR) unify code for double and single versions 456
General: (RmS) New size function macro <code>\genb@sfcnt</code> needs to be disabled at <code>\document.</code> . . . 154		<code>\end@float</code> : (CAR) unify code for double and single versions . . . 455
1995-10-22 ltfsstrc.dtx v3.0f		1995-10-25 ltidxglo.dtx v1.1d
General: Added ‘genb’ and ‘sgenb’ size functions to support new DC font naming scheme. . . . 193		General: Doc cleanup 467
1995-10-23 lttab.dtx v1.1f		1995-10-25 ltsect.dtx v1.0q
<code>\@settab</code> : (CAR)Ensure that <code>\@hightab</code> increases by at most one 394		<code>\subparagraphmark</code> : Use <code>\let</code> not <code>\def</code> to save space. 443
<code>\@startline</code> : (CAR)Ensure that <code>\@nxttabmar</code> is never larger than <code>\@hightab</code> 392		1995-10-27 ltpictur.dtx v1.1f
<code>\@poptabs</code> : (CAR)Ensure that <code>\@curtab</code> is never larger than <code>\@hightab</code> 395		General: Move initialisation to kernel from autoloading file . . . 428
<code>\@tabbing</code> : (CAR)Make <code>\@hightab</code> consistently a local variable . 393		1995-10-31 ltboxes.dtx v1.0x
1995-10-24 ltfiles.dtx v1.1a		<code>\@finalstrut</code> : Add <code>\nobreak</code> in horiz mode to allow hyphenation. internal/1931 . 386
<code>\document</code> : Removed multiplelabels switch 91		1995-11-01 fontdef.dtx v2.2m
Removed refunddefined switch . 91		General: add <code>\nfss@catcodes</code> for internal/1932 265
1995-10-24 ltfsbas.dtx v3.0k		1995-11-01 ltdirchk.dtx v1.0n
<code>\@@defaults</code> : macro removed 171		General: Initialise <code>\@addtofilelist</code> to <code>\@gobble</code> . 4
<code>\wrong@fontshape</code> : Make this code inline since it happens only here 170		1995-11-01 ltfinal.dtx v1.0x
1995-10-24 ltmiscen.dtx v1.1b		General: (DPC) Switch meaning of <code>\@addtofilelist</code> for cfg files 615
<code>\enddocument</code> : Changed logic for producing warning messages and removed switch 333		1995-11-01 ltfsbas.dtx v3.0m
Use <code>\@refunddefined</code> instead of switch 333		<code>\DeclareFontShape</code> : (DPC) Test for <code>\relax</code> not <code>\undefined</code> , internal/1933 155
1995-10-24 ltxref.dtx v1.1h		1995-11-01 ltssini.dtx v3.0g
<code>\@multiplelabels</code> : Switch for multiplelabels removed 329		General: (DPC) Switch meaning of <code>\@addtofilelist</code> for cfg files 260
<code>\@newl@bel</code> : Switch for multiplelabels replaced by inline code 329		1995-11-02 ltfsbas.dtx v3.0n
<code>\@refunddefined</code> : Switch for refunddefined replaced 328		<code>\wrong@fontshape</code> : (DPC) Remove extra space with <code>\string</code> for latex/1676 170
<code>\@setref</code> : Switch for refunddefined renamed 329		1995-11-02 ltoutenc.dtx v1.7n
<code>\if@multiplelabels</code> : Macro removed 329		General: Changed internal name <code>\a</code> to <code>\@tabacckludge</code> to protect against redefinition by malicious users. 114
1995-10-25 ltalloc.dtx v1.1b		1995-11-07 ltlists.dtx v1.0k
General: General doc improvements 54		<code>\@doendpe</code> : Enclosed <code>\setbox0</code> assignment by a group so that it leaves the contents of box 0 intact. 369
1995-10-25 ltfloat.dtx v1.1n		1995-11-07 ltoutenc.dtx v1.7o
<code>\@endfloatbox</code> : (CAR) macro added: to unify code for double and single versions 457		General: Added <code>\leavevmode</code> at start of <code>\c</code> , otherwise the output routine might be invoked within the macro. . . 118
		Changed <code>\char32</code> to <code>\@xxxii</code> (two tokens less). 119

Replaced octal number 27 by decimal number 23 to protect against the quote character being active.	119	<code>\textasciitilde</code> , <code>\textbackslash</code> , <code>\textbar</code> , <code>\textgreater</code> and <code>\textless</code>	121
Replaced some 0's by <code>\z@</code> (faster).	119	Added <code>\textasciicircum</code> , <code>\textasciitilde</code> , <code>\textregistered</code> and <code>\texttrademark</code>	115
1995-11-10 ltoutput.dtx v1.1s <code>\@shipoutsetup</code> : Command removed	503	Added <code>\textbackslash</code> and <code>\textbar</code>	115, 125
<code>\@writsetup</code> : Command removed	503	Added <code>\textless</code> and <code>\textgreater</code>	115, 126
In-lined	503	1995-12-01 ltoutenc.dtx v1.7u General: Made <code>\SS</code> a Default, rather than having the default point to the OT1 definition.	115
1995-11-14 ltclass.dtx v1.0t <code>\@unprocessedoptions</code> : Allow empty option	566	1995-12-04 ltspac.dtx v1.2k <code>\nobreakspace</code> : (Macro added	84
<code>\loadwithoptions</code> : macro added	560	1995-12-04 ltspac.dtx v1.2l <code>\xobeysp</code> : (braces added to definition of tilde	84
<code>\LoadClassWithOptions</code> : macro added	561	1995-12-04 preload.dtx v2.4e General: Ulrik Vieth. added 12pt OMS and OML preloads /1989	284
<code>\RequirePackageWithOptions</code> : macro added	561	1995-12-05 ltdefns.dtx 1.2w <code>\@unexpandable@protect</code> : Removed <code>\unexpandable@noexpand</code> as never used. internal/1733	45
1995-11-17 ltffsbas.dtx v3.0m <code>\@wrong@font@char</code> : (DPC) Macro added. latex/1676	171	1995-12-05 ltfiles.dtx v1.1c <code>\document</code> : <code>\ignorespaces</code> added for latex/1933	92
<code>\define@newfont</code> : Redefine <code>\typeout</code> latex/1676	164	1995-12-05 ltfloat.dtx v1.1n <code>\@textsuperscript</code> : Use <code>\ensuremath</code> for latex/1984.	465
<code>\wrong@fontshape</code> : Support <code>\@wrong@font@char</code> latex/1676	170	1995-12-05 ltoutenc.dtx v1.7v <code>\@inmathwarn</code> : Changed <code>\TextSymbolUnavailable</code> text	107
1995-11-17 ltoutenc.dtx v1.7p <code>\UseTextSymbol</code> : Support <code>\@wrong@font@char</code> latex/1676	111	1995-12-06 ltffsbas.dtx v3.00 <code>\nfss@catcodes</code> : Reset hat, for typeouts etc in fd files	166

1997-04-14 ltfiles.dtx v1.1k		
<code>\document</code> : Set the document space factor defaults. latex/2404		91
<code>\normalsfcodes</code> : Macro added (from patch file) latex/2404 ..		93
1997-04-14 ltoutput.dtx v1.2b		
<code>\@writsetup</code> : Call		
<code>\normalsfcodes</code> (from patch file) latex/2404		505
Move <code>\label</code> and <code>\index</code> (from patch file)		505
1997-04-24 ltbibl.dtx v1.1m		
<code>\@citex</code> : <code>\@empty</code> to avoid primitive error on empty cite keys. latex/2432		470
1997-04-30 ltoutenc.dtx v1.9a		
General: Changed <code>\textsc</code> to <code>\scshape</code>		116
Introduced <code>\textcopyright</code> and modified <code>\copyright</code>		115
Introduced <code>\textcopyright</code> and modify <code>\copyright</code>		116
Modified <code>\textunderscore</code> , removing <code>\mathunderscore</code> .		116
1997-04-30 ltoutenc.dtx v1.9b		
General: Added <code>\leavevmode</code> to <code>\textunderscore</code>		116
1997-05-04 ltoutenc.dtx v1.9c		
General: Added ‘hex index tabs’ .		122
Added TS1 encoding v2.2.beta		128
1997-05-07 ltoutenc.dtx v1.9d		
General: Added <code>\leavevmode</code> to <code>\textcompwordmark</code>		116
1997-05-07 ltspace.dtx v1.2v		
<code>\newline</code> : Made completely robust.		76
1997-05-29 ltfstrc.dtx v3.0j		
General: Replaced <code>\</code> by <code>\MessageBreak</code> , as suggested by Donald Arseneau.		195
1997-05-29 ltlogos.dtx v1.1f		
\LaTeX : Added <code>\m@th</code> so that the \LaTeX 2 ϵ logo works with non-zero values of <code>\mathsurround</code>		87
1997-06-16 ltdirchk.dtx v1.0v		
General: documentation improvements mainly from internal/2520		1
1997-06-16 ltfloat.dtx v1.1s		
General: documentation fixes ...		448
1997-06-16 ltfntcmd.dtx v3.3v		
General: Fix typo in documentation.		286
1997-08-05 ltoutenc.dtx v1.9e		
General: Corrected order of arguments in <code>\UseTextSymbol</code> example.		103
1997-08-29 ltoutenc.dtx v1.9f		
General: Added OT4 encoding, provided by Marcin Woliński.		102
1997-09-09 ltdefns.dtx v1.2z		
<code>\providecommand</code> : Use <code>\begingroup</code> to avoid generating math ords if used in math mode. pr/2573		43
1997-09-15 ltpictur.dtx v1.1g		
<code>\@getcirc</code> : Warn if lines become invisible pr/2524		425
<code>\@picture@warn</code> : Macro added pr/2524		425
<code>\@sline</code> : Warn if lines become invisible pr/2524		416
1997-10-06 ltcounts.dtx v1.1f		
<code>\@Roman</code> : Change <code>\@Roman</code> to be fully expandable, so that the		

- result is written properly to files. 150
- `\@slowromancap`: Macro added. . 150
- 1997-10-08 `ltlogos.dtx` v1.1h
- `\LaTeX`: Simplify macro (force loading of suitable math fonts once). 87
- 1997-10-10 `ltclass.dtx` v1.0y
- `\endfilecontents`: `\@currenvir` in banner 569
- `\reserved@c` not `\verbatim@out` to save a csname 568
- Check for text before or after `\end environment`. `latex/2636` 569
- Use `\@gobbletwo` 568
- 1997-10-17 `lftntcmd.dtx` v3.3w
- `\check@nocorr@`: Check for vertical mode moved here, from `\DeclareTextFontCommand` (see `PR/2646`). 290
- `\DeclareTextFontCommand`: Reinstalled `\check@icr` as check is now done in `\check@nocorr@` (see `PR/2646`). 288
- 1997-10-20 `ltfinal.dtx` v1.1a
- `\@uclclist`: Removed `\aa` and `\AA` from `\@uclclist` as these are macros. 621
- 1997-10-21 `ltdefns.dtx` v1.2z1
- `\renew@command`: Use `\begingroup/\endgroup` rather than braces for grouping, to avoid generating empty math atom. 41
- 1997-10-21 `ltfssbas.dtx` v3.0t
- `\define@newfont`: Move `\makeatletter` to `\nfss@catcodes`. 165
- `\nfss@catcodes`: Moved `\makeatletter` from `\try@load@font@shape`. . . . 166
- 1997-11-09 `ltoutput.dtx` v1.2c
- `\@specialoutput`: Remove incorrect code: only one `\@emptycol` is needed here . . 494
- `\@topnewpage`: Documentation of vsize check enhanced 491
- 1997-11-13 `ltfssdcl.dtx` v3.0f
- `\DeclareSymbolFont`: (DPC) Really update `\group@list` dont leave new version in `\toks@`. `latex/2661` 228
- `\stepcounter`: (DPC) Remove as never used. (Re)defined in `ltcounts` 222
- 1997-11-19 `ltfloat.dtx` v1.1t
- `\@footnotetext`: Missing percent, again 465
- 1997-11-19 `ltoutput.dtx` v1.2d
- `\@vtryfc`: Reindent code, to be understandable(DPC). 510
- 1997-11-20 `ltfssdcl.dtx` v3.0g
- `\document@select@group`: (DPC) inline use of `\stepcounter` (faster, and saves a csname per math version as no reset list) 224
- `\select@group`: (DPC) inline use of `\stepcounter` (faster, and saves a csname per math version as no reset list) 222
- 1997-11-23 `ltoutenc.dtx` v1.9g
- General: Use `\textperthousand`, `\textpertenthousand` and `\textfractionsolidus` not `\textpermill`, `\textpertenmill` and `\textfraction`. `/2673` 128
- 1997-12-17 `ltoutenc.dtx` v1.9h
- General: Added `\textperthousand` and `\textpertenthousand` . . 120, 121
- Added code for `textcomp.sty`. . 142
- Added section. 142
- Added `textcomp.sty`. 102
- As in OT1, Added `\leavevmode` at start of `\c`, otherwise the output routine might be invoked within the macro. . . 120
- Changed to decimal codes in `\oalign`. 130
- Changed to decimal codes. . . . 126
- Documentation changes and additions. 102
- Example corrected, braces removed. 102
- Removed default settings, see next section. 128
- 1997-12-19 `ltoutenc.dtx` v1.9i
- General: Documentation corrections. 102
- 1997-12-20 `fontdef.dtx` v2.2s
- General: Added documentation . 264
- 1997-12-31 `ltoutenc.dtx` v1.9k
- General: Further correction . . . 103

1998-01-12 ltoutenc.dtx v1.9k	1998-04-18 fontdef.dtx v2.2w
General: Added <code>\ProvidesPackage</code>	General: Reinsert symbol def for /

		General: Ensure that we also forget old options (pr/2888) .	145

- 1999-06-12 ltoutenc.dtx v1.9v
 General: Extend `\uc1clist` only
 once 144
- 1999-10-09 ltmath.dtx v1.1e
`\active@math@prime`: Macro
 added, see PR 3104. 351
`\prime@:` Introduce
`\active@math@prime.` 351
- 1999-10-09 ltoutput.dtx 1.2f
`\@activechar@info`: Reset
 definition of active prime
 character (used in math
 mode) 503
- 1999-10-28 ltoutenc.dtx v1.9w
`\add@accent`: Give
`\accent@spacefactor` a
 default definition (pr/3084) . 109
- 1999-12-08 ltoutenc.dtx v1.9x
 General: Changed `\CYRRHOOK` and
`\cyrrhook` to `\CYRRHK` and
`\cyrrhk` as name changed in
 the cyrillic bundle for naming
 consistency with other “hook”
 glyphs. 143
- 2000-01-07 ltmiscen.dtx v1.1h
`\@verbatim`: Disable hyphenation
 even if the font allows it. ... 342
- 2000-01-15 ltpictur.dtx v1.1i
`\@upvector`: Removed space at
 end-of-line, CAR 418
- 2000-01-30 ltfntcmd.dtx v3.3y
`\DeclareTextFontCommand`: Use
`\hmode@bgroup` now (pr/3160) 288
- 2000-01-30 ltoutenc.dtx v1.9y
 General: Use `\hmode@bgroup`
 where applicable (pr/3160) .
 118–120, 125, 127, 128, 130
`\add@accent`: Use `\hmode@bgroup`
 where applicable (pr/3160) . 108
`\hmode@bgroup`: Macro added ... 109
- 2000-01-30 ltoutenc.dtx v1.9z
`\@use@text@encoding`: Macro
 reimplemented (pr/3160) 111, 112
`\add@accent`: Macro
 reimplemented (pr/3160) ... 108
`\hmode@start@before@group`:
 Macro added (pr/3160) 112
- 2000-05-19 ltmiscen.dtx v1.1i
`\enddocument`: Reset
`\AtEndDocument` for
 latex/3060 332
- 2000-05-26 ltpage.dtx v1.0j
`\@markright`: Reimplementation to
 fix expansion error (pr/3203). 475
- `\leftmark`: Use `\@empty` instead of
 brace group (pr/3203). 475
`\markright`: Reimplementation to
 fix expansion error (pr/3203). 474
`\rightmark`: Use `\@empty` instead
 of brace group (pr/3203). .. 475
- 2000-06-02 ltpage.dtx v1.0k
`\@markright`: Small adjustment to
 give slightly less expansion,
 CAR 475
`\markright`: Small adjustment to
 give slightly less expansion,
 CAR 474
 Tidied 1.0j reimplementation,
 CAR 474
- 2000-07-11 ltmiscen.dtx v1.1j
`\enddocument`: Fix typo in
 warning 333
- 2000-07-12 ltoutput.dtx 1.2g
 General: Ensure that rule is in
`\normalcolor` 542
- 2000-07-12 ltoutput.dtx 1.2i
`\@makecol`: Removed negative
 vskip, as it gives unacceptable
 results when the depth is large:
 pr/3189 499
- 2000-07-19 ltoutput.dtx v1.2h
`\@writesetup`: Reset and restore
`\@if@newlist` for
 internal/3231 504
- 2000-08-23 ltfinal.dtx v1.1c
 General: Fix typo in warning ... 616
- 2000-08-30 ltoutenc.dtx v1.91
`\@use@text@encoding`: Rearranged
 but no change to final code,
 CAR (pr/3160) 111
`\add@accent`: Rearranged but no
 change to final code, CAR
 (pr/3160) 108
- 2000-09-01 ltfinal.dtx v1.1d
`\errhelp`: Set error help empty at
 very end (pr/449 done
 correctly). 623
- 2000-09-24 ltfloat.dtx v1.2b
`\end@dblfloat`: FMI: use output
 routine to defer float 456
- 2000-09-24 ltoutput.dtx v1.2b
`\@doclearpage`: FMI: ensure
`\doclearpage` is called again
 until all floats are output. ... 497
- 2000-09-24 ltoutput.dtx v1.2n
`\@addtocurcol`: FMI: test for wide
 float was in wrong place ... 515
